Received 24 March 2010; accepted 28 March 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean  $\sigma$ (C–C) = 0.002 Å; R factor = 0.033; wR factor = 0.089; data-to-parameter ratio = 14.1.

In the title compound,  $C_{15}H_{12}ClN_3O$ , the quinoline ring system is essentially planar, with a maximum deviation of 0.017 (1) Å. The crystal packing is stabilized by  $\pi$ - $\pi$  stacking interactions between the quinoline rings of adjacent molecule, with a centroid-centroid distance of 3.5913 (8) Å. A weak C-H··· $\pi$  contact is also observed between molecules.

## 2-Chloro-8-methyl-3-[(pyrimidin-4-yloxy)methyl]quinoline

## F. N. Khan, S. M. Roopan, V. R. Hathwar and M. Akkurt

### Comment

Alkylating agents have been studied extensively both for their biological effects and for their mode of action (Singer *et al.*, 1986). There have been over the past 25 years a veritable deluge of reviews, often focusing on a single aspect or agent or adduct. Direct alkylation of oxygens in pyrimidine nucleosides, under physiological conditions, has been known only since the middle 1970s. The pyrimidine analogues (Svenstrup *et al.*, 2008) such as naturally occurring azacamptothecin based molecule have been focused of great interest by reason of their diversified biological activities. Thus, modifications of biologically active azacamptothecin synthesis and regioselective alkylation of 4(3H)-pyrimidone (Roopan *et al.*, 2010), we report herein the synthesis of 2-chloro-8-methyl-3-[(pyrimidin-4-yloxy)methyl]quinoline.

In the molecule of the title compound, Fig. 1, bond lengths and angles are in normal ranges (Allen *et al.*, 1987). The quinoline ring system (N1/C1–C9) is essentially planar, with a maximum deviation of -0.017 (1) Å for atom C1. The quinoline system (N1/C1–C9) makes a dihedral angle of 4.99 (6)° with the piyrimidone ring (N2/N3/C11–C14).

In the title molecule, there is a weak intramolecular C—H···O interaction, generating an S(5) graph-set motif (Bernstein *et al.*, 1995) (Table 1). The crystal packing is stabilized by  $\pi$ - $\pi$  stacking interactions between the benzene rings of the quinoline ring system of the molecules related by the symmetry operator (1-x, 1-y, -z) [centroid-to-centroid distance = 3.5913 (8) Å]. In addition, a weak C—H··· $\pi$  contact is also observed between molecules (Table 1). The packing diagram viewing down the b-axis is shown in Fig. 2.

### Experimental

To a mixed well solution of 4(3*H*)-pyrimidone (96 mg, 1 mmol, in 5 ml DMSO), NaH (25 mg, 1 mmol) and 2-chloro-3-(chloromethyl)-8-methylquinoline (225 mg, 1 mmol) were added and the resulting mixture was refluxed for 1 h. Completion of the reaction was monitored by TLC. After the completion of the reaction, cooled and removed the excess of solvent under reduced pressure. Crushed ice was mixed with the residue. White solid was formed, filtered and dried, purified by column chromatography using hexane and ethylacetate as the eluant. The low polar compound was subjected into crystallization by solvent evaporation from a solution of the compound in chloroform.

#### Refinement

All H atoms were placed in geometrically idealised positions and constrained to ride on their parent atoms (C—H = 0.93, 0.96 and 0.97 Å) and  $U_{iso}(H)$  values were taken to be equal to 1.2  $U_{eq}(C)$  for aromatic and methylene H atoms and 1.5 $U_{eq}(C)$  for methyl H atoms.

Figures

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. Packing diagram of the title compound viewed down b-axis. All H atoms have been omitted for clarity.

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.089$	H-atom parameters constrained
<i>S</i> = 1.07	$w = 1/[\sigma^2(F_o^2) + (0.0503P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2564 reflections	$(\Delta/\sigma)_{\rm max} < 0.001$
182 parameters	$\Delta \rho_{\text{max}} = 0.18 \text{ e} \text{ Å}^{-3}$
0 restraints	$\Delta \rho_{\rm min} = -0.20 \ e \ {\rm \AA}^{-3}$

#### Special details

**Geometry**. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement**. Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors wR and all goodnesses of fit *S* are based on  $F^2$ , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating *-R*-factor-obs etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
