M_r = 484.61	F(000) = 524
Triclinic, $P\overline{1}$	D_x = 1.145 Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, λ = 0.71073 Å
a = 8.3154 (6) Å	Cell parameters from 4014 reflections
b = 12.5589 (8) Å	θ = 2.5–27.3°
c = 13.9410 (9) Å	μ = 0.08 mm^{-1}
α = 101.782 (1)°	T = 293 K
β = 97.529 (1)°	Block, colourless
γ = 94.156 (1)°	0.45 × 0.35 × 0.30 mm
V = 1405.52 (16) Å^3	

Data collection

Bruker SMART APEX diffractometer	4482 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	R_{int} = 0.021
graphite	θ_{max} = 27.5°, θ_{min} = 1.7°
ω scans	h = −10→10
13784 measured reflections	k = −16→14
6428 independent reflections	l = −18→17

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.060	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.184	H-atom parameters constrained
S = 1.03	$w = 1/[\sigma^2(F_o^2) + (0.0989P)^2 + 0.2549P]$ where $P = (F_o^2 + 2F_c^2)/3$
6428 reflections	$(\Delta/\sigma)_{max}$ = 0.001
318 parameters	$\Delta\rho_{max}$ = 0.35 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.19 e Å^{-3}

Received 17 June 2010; accepted 21 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.108; data-to-parameter ratio = 13.8.

In the title compound, $C_{13}H_{11}N_3O_4$, the dioxane ring adopts an envelope conformation with the C atom bonded to the dimethyl group in the flap position [deviation = 0.613 (1) Å]. The nitrile group and the attached benzene ring are roughly coplanar [maximum deviation = 0.087 (1) Å]. An intramolecular N—H···O hydrogen bond involving the hydrazinyl group generates an S(6) ring. The N—N and C—N bond lengths indicate that the compound may be a mixture of the azo and hydrazone tautomeric forms but the presence of the N-bound H atom supports the hydrazone form. The crystal structure is stabilized by weak intermolecular C—H···O, C—H···N and C—H···π interactions.

4-[2-(2,2-Dimethyl-4,6-dioxo-1,3-dioxan-5-ylidene)hydrazin-1-yl]benzonitrile

N. Çolak, Y. Yildirir, B. Tercan, E. Ermis and T. Hökelek

Comment

It has been known for many years that the azo compounds are widely used class of dyes due to their applications in various fields such as the dyeing of textile fibers, the coloring of different materials, colored plastics and electrochemical sensors (Kobrakov *et al.*, 2004; Karcı *et al.*, 2004; Gale *et al.*, 1998). Azo dyes have been attracting intensive interest for their potential use in optical data storage (Natansohn *et al.*, 1992), optical switching (Ikeda & Tsutsumi, 1995), polarization holography (Kim *et al.*, 1995; Rochon *et al.*, 1995), optical modulation (Buchel *et al.*, 1995), nonlinear optics (Branger *et al.*, 1997) and photolabile surfactants (Kang *et al.*, 2000).

The dyes may exist in two possible tautomeric forms, namely azo form and hydrazone form. The azo-hydrazone tautomerism is quite interesting from a theoretical and practical point of view because the two tautomers have different properties. Azo dyes are known to exist in the azo-hydrazone tautomeric forms (Çolak *et al.*, 2010; Pavlovic *et al.*, 2009; Seferoğlu *et al.*, 2009; Seferoğlu *et al.*, 2008; Wojciechowski & Szymezak, 2007). We herein report the crystal structure of the title compound, (I).

The title compound, (I), contains benzonitrile and 2,2-dimethyl-1,3-dioxane -4,6-dione groups connected *via* a hydrazinyl group (Fig. 1). In (I), N1—N2 [1.3082 (14) Å] bond length is between the N═N double bond [1.20–1.28 Å for a real azo compound] and N—N single bond [longer than 1.4 Å] lengths. The N1—C3 and N2—C5 bond lengths are 1.3116 (14) and 1.4075 (14) Å, respectively. The carbonyl O atoms O3 and O4 slightly deviate from the N1/C2–C4 plane by 0.255 (2) and 0.259 (2) Å, respectively. So, the title compound may exist both in azo and hydrazone tautomeric forms, and is mainly in the hydrazone tautomeric form. The C8—C13 [1.4418 (15) Å] bond length is longer for a $C(sp^2)$—$C(sp^1)$ bond, but in agreement with the previously reported value [1.442 (3) Å; Çolak *et al.*, 2010).

An intramolecular N2—H2···O3 hydrogen bond (Table 1) results in the formation of a nearly planar [with a maximum deviation of 0.056 (1) Å for atom C4] six-membered ring C (O3/N1/N2/H2/C3/C4), which is oriented with respect to the benzonitrile ring B (C5–C10) at a dihedral angle of 7.8 (43)°. Atoms N1, N2, N3 and C13 are displaced by -0.162 (2), 0.038 (2), 0.049 (2) and 0.028 (2) Å from the plane of ring B, respectively. The benzonitrile and hydrazinyl groups (4-hydrazinylbenzonitrile) are essentially coplanar [with a maximum deviation of -0.087 (1) Å for atom N1]. The dioxane ring A (O1/O2/C1–C4) is not planar having envelope conformation with atom C1 displaced by 0.613 (1) Å from the plane of the other ring atoms.

In the crystal structure, weak C—H···O and C—H···N hydrogen bonds (Table 1) may be effective in the stabilization of the crystal packing. There also exists a weak C—H···π interaction (Table 1).

Experimental

A hydrochloric acid solution (2.5 ml) of 4-aminobenzonitrile (1.18 g, 10 mmol) and an aqueous solution (10 ml) of sodium nitrite (0.69 g, 10 mmol) were mixed and stirred at 273 K for 1 h. To this solution, an ethanol solution (10 ml) of the coupling

component 2,2-dimethyl-1,3-dioxane-4,6-dione (1.44 g, 10 mmol) was added and the stirring was continued at 273 K for 4 h. The resulting product was filtered and washed with water, dried and crystallized from ethanol (yield 1.88 g, 69%; m.p. 440–442 K).

Refinement

H atoms were located in difference Fourier maps and refined isotropically.

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.108$	All H-atom parameters refined
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0626P)^2 + 0.2729P]$ where $P = (F_o^2 + 2F_c^2)/3$
3098 reflections	$(\Delta/\sigma)_{max} = 0.001$
225 parameters	$\Delta\rho_{max} = 0.38$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.24$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 18 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.037; wR factor = 0.097; data-to-parameter ratio = 16.8.

The molecule of the title compound, $C_3H_2ClN_3O_2$, is almost planar; the dihedral angle between the imidazole ring and the nitro group is 1.7 (2)°. In the crystal structure, pairs of intermolecular C—H···O hydrogen bonds link inversion-related molecules into dimers, generating $R_2^2(10)$ ring motifs. The dimers are interconnected into two-dimensional networks parallel to (102) *via* intermolecular N—H···N hydrogen bonds. Further stabilization is provided by short intermolecular Cl···O interactions [3.142 (2) and 3.1475 (19) Å].

HKF and JHG thank Universiti Sains Malaysia (USM) for the Research University Golden Goose grant (No. 1001/PFIZIK/811012). JHG also thanks USM for the award of a USM fellowship. AMI is grateful to the Director, National Institute of Technology-Karnataka and the Head of the Chemistry Department for their encouragement. BC is thankful to Dr John Kallikat of Syngene International Ltd for the research encouragement. AMI also thanks USM for a partially sponsored research visit to the X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia.

Supplementary data and figures for this paper are available from the IUCr electronic archives (Reference: CI5106).

2-Chloro-4-nitro-1*H*-imidazole

H.-K. Fun, J. H. Goh, B. Chandrakantha, A. M. Isloor and P. Shetty

Comment

The nitro aromatic compounds are used as key substrates for the preparation of useful materials such as dyes, pharmaceuticals, perfumes and plastics (Susanta *et al.*, 2000). Therefore, nitration of hydrocarbons particularly of aromatic compounds is probably one of the most widely studied organic reactions (Jadhav *et al.*, 2008). In addition, they have proven to be valuable reagents for the synthesis of complex target molecules (Kolavi *et al.*, 2006). Most of the substituted imidazoles are widely used in pharmaceutical ingredients (Clark & Macquarrie, 1996). The imidazole nucleus is one of the important heterocyclic groups due to its presence in a large number of bioactive pharmaceutical and agrochemicals (Anuradha *et al.*, 2006). It was also reported that a large number of compounds containing the imidazole ring possess some moderately useful activities. The environmentally friendly nitration reaction has been the focus of recent research.

In the title imidazole derivative, the 1*H*-imidazole ring with atom sequence C1/N1/C2/C3/N2 is essentially planar, with a maximum deviation of 0.003 (2) Å at atom N1. The nitro group is coplanar with the attached 1*H*-imidazole ring, as indicated by the dihedral angle of 1.7 (2)°. The geometric parameters agree well with those reported for related 4-nitroimidazole structures (Ségalas *et al.*, 1992; De Bondt *et al.*, 1993).

In the crystal structure, (Fig. 2), pairs of intermolecular C2—H2···O1 hydrogen bonds (Table 1) link inversion-related molecules into dimers, generating $R^2_2(10)$ hydrogen bond ring motifs (Bernstein *et al.*, 1995). These dimers are further interconnected into two-dimensional arrays parallel to the (102) plane *via* intermolecular N1—H1N1···N2 hydrogen bonds (Table 1). The interesting features of the crystal structure are the intermolecular short Cl···O interactions [$Cl1\cdots O1^{iii}$ = 3.143 (2) and $Cl1\cdots O2^{i}$ = 3.148 (2) Å; (i) 1-x, y-1/2, 1/2-z and (iii) 1+x, 3/2-y, z-1/2] which are shorter than the sum of the van der Waals radii of the relavant atoms and help to further stabilize the crystal structure.

Experimental

Nitronium tetrafluoroborate (1.42 g, 0.0107 mol) was dissolved in nitromethane (10 ml) and 2-chloroimidazole (1 g, 0.0097 mol) was then added in lot-wise. The reaction mixture was stirred at room temperature for 3 h. The reaction mixture was then neutrallized with an aqueous solution of sodium bicarbonate. The separated solid was then filtered. The crude product was purified by column chromatography using 60–120 silica gel. The fraction eluted at 10 % ethyl acetate in hexane was concentrated to afford the title compound as pale yellow single crystals (Yield 0.9 g, 62.93 %; *m.p.* 363–366 K).

Refinement

Atoms H1N1 and H2 were located in a difference Fourier map and allowed to refine freely [N1—H1N1 = 0.86 (3) and C2—H2A = 0.93 (3) Å].

Data collection

Bruker APEXII DUO CCD area-detector diffractometer	1509 independent reflections
Radiation source: fine-focus sealed tube	1195 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.037$
φ and ω scans	$\theta_{max} = 30.0°$, $\theta_{min} = 3.1°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -6 \rightarrow 8$
$T_{min} = 0.837$, $T_{max} = 0.977$	$k = -13 \rightarrow 14$
5484 measured reflections	$l = -12 \rightarrow 12$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.037$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.097$	All H-atom parameters refined
$S = 1.11$	$w = 1/[\sigma^2(F_o^2) + (0.0453P)^2 + 0.1822P]$ where $P = (F_o^2 + 2F_c^2)/3$
1509 reflections	$(\Delta/\sigma)_{max} = 0.001$
90 parameters	$\Delta\rho_{max} = 0.42$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.44$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 299 K; mean σ(C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.109; data-to-parameter ratio = 15.0.

In the title compound, $C_{14}H_{13}NO_3S$, the conformation of the N—H bond in the C—SO_2—NH—C(O) segment is *anti* to the C=O bond. The dihedral angle between the sulfonyl benzene ring and the S—N—C—O segment (r.m.s. deviation = 0.039 Å) is 77.1 (1)° and that between the sulfonyl and benzoyl benzene rings is 71.9 (1)°.

N-(4-Methylbenzoyl)benzenesulfonamide

P. A. Suchetan, B. T. Gowda, S. Foro and H. Fuess

Comment

As a part of studying the effect of ring and the side chain substituents on the crystal structures of *N*-aromatic sulfonamides (Gowda *et al.*, 2009; Suchetan *et al.*, 2009, 2010), the crystal structure of *N*-(4-methylbenzoyl)benzenesulfonamide has been determined (Fig. 1). The conformation of the N—H bond in the C—SO_2—NH—C(O) segment is *anti* to the C═O bond, similar to those observed in *N*-(benzoyl)benzenesulfonamide (II) (Gowda *et al.*, 2009), *N*-(benzoyl)-4-methylbenzenesulfonamide (III) (Suchetan *et al.*, 2010) and *N*-(4-chlorobenzoyl)-benzenesulfonamide (IV) (Suchetan *et al.*, 2009).

The molecules are twisted at the S—N bonds with the C—SO_2—NH—C torsional angle of 67.4 (1)°, compared to the values of -66.9 (3)° in (II), 73.2 (2)° in (III) and 69.4 (2)° in (IV).

The dihedral angle between the sulfonyl-bound benzene ring and the S—N—C—O segment (r.m.s. deviation 0.039 Å) is 77.1 (1)°, compared to the values of 86.5 (1)° in (II), 76.5 (1)° in (III) and 75.7 (1)° in (IV).

The dihedral angle between the sulfonyl and the benzoyl benzene rings is 71.9 (1)°, compared to the values of 80.3 (1) in (II), 79.4 (1)° in (III), and 68.6 (1)° in (IV).

Experimental

The title compound was prepared by refluxing a mixture of 4-methylbenzoic acid, benzenesulfonamide and phosphorous oxy chloride for 3 h on a water bath. The resultant mixture was cooled and poured into ice cold water. The solid obtained was filtered, washed thoroughly with water and then dissolved in a sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. It was filtered, dried and recrystallized. Colourless needle-shaped single crystals of the title compound used in X-ray diffraction studies were obtained by slow evaporation of its toluene solution at room temperature.

Refinement

H atoms were positioned with idealized geometry using a riding model with N–H = 0.86 Å, C–H = 0.93–0.96 Å and were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

Figures

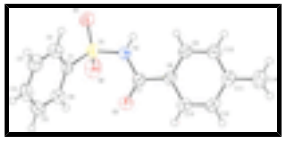

Fig. 1. Molecular structure of the title compound, showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

Received 18 June 2010; accepted 20 June 2010

Key indicators: single-crystal X-ray study; T = 299 K; mean σ(C–C) = 0.005 Å; R factor = 0.066; wR factor = 0.184; data-to-parameter ratio = 12.6.

In the title compound, $C_{13}H_9Cl_2NO_3S\cdot H_2O$, the conformation of the C=O bond is *syn* to the *meta*-Cl group in the benzoyl ring. The molecules are twisted at the S—N bond with a C—S—N—C torsion angle of 72.9 (2)°. The dihedral angle between the sulfonyl benzene ring and the S—NH—C—O segment is 77.8 (1)° and that between the sulfonyl and benzoyl benzene rings is 80.5 (1)°. In the crystal, molecules are linked into a two-dimensional network parallel to (100) by N—H···O and O—H···O hydrogen bonds.

4-Chloro-*N*-(3-chlorobenzoyl)benzenesulfonamide monohydrate

P. A. Suchetan, B. T. Gowda, S. Foro and H. Fuess

Comment

As a part of studying the effect of ring and the side chain substituents on the crystal structures of *N*-aromatic sulfonamides (Gowda *et al.*, 2009, 2010; Suchetan *et al.*, 2010*a,b*), the structure of 4-chloro-*N*-(3-Chlorobenzoyl)benzenesulfonamide monohydrate (I) has been determined (Fig.1).

The conformation of the N—H bond in the C—SO_2—NH—C(O) segment is *anti* to the C═O bond, similar to those observed in *N*-(3-chlorobenzoyl)-benzenesulfonamide (II) (Gowda *et al.*, 2009), *N*-(benzoyl)-4-chlorobenzenesulfonamide (III) (Suchetan *et al.*, 2010*a*), 4-chloro-*N*-(2-chlorobenzoyl)benzenesulfonamide (IV) (Gowda *et al.*, 2010), and *N*-(4-chlorobenzoyl)-4- chlorobenzenesulfonamide (V) (Suchetan *et al.*, 2010*b*).

Further, the conformation of the C═O bond in the C—SO_2—NH—C(O) segment of (I) is *syn* to the *meta*-Cl in the benzoyl ring, similar to that observed between the C═O bond and *ortho*-Cl in (IV), but contrary to the *anti* conformation observed between the C═O bond and *meta*-Cl in (II).

The molecules are twisted at the S—N bond with the C1—S1—N1—C7 torsional angle of 72.9 (2)°, compared to those of 65.3 (2)° in (II), -70.0 (2)°, 61.3 (2)° in the two independent molecules of (III), 65.7 (2)° in (IV) and 67.5 (3)° in (V).

The dihedral angles between the sulfonyl benzene ring and the S/N/C/O plane is 77.8 (1)°, compared to the values of 89.9 (1)° in (II), 72.0 (1)° & 77.3 (1)° in the two molecules of (III), 88.5 (1)° in (IV) and 79.0 (1)° in (V).

Furthermore, the dihedral angle between the sulfonyl and the benzoyl benzene rings is 80.5 (1)°, compared to the values of 87.5 (1)° in (II), 62.8 (1)° (molecule 1) and 78.6 (1)° (molecule 2) of (III), 58.0 (1)° in (IV) and 85.6 (1)° in (V)

The molecules are linked into a two-dimensional network (Fig.2) parallel to the (100) by N—H···O and O—H···O hydrogen bonds (Table 1).

Experimental

The title compound was prepared by refluxing a mixture of 3-chlorobenzoic acid, 4-chlorobenzenesulfonamide and phosphorous oxy chloride for 3 h on a water bath. The resultant mixture was cooled and poured into ice cold water. The solid obtained was filtered, washed thoroughly with water and then dissolved in sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. It was filtered, dried and recrystallized. Long needle like colourless single crystals of the title compound used in X-ray diffraction studies were obtained by slow evaporation of its toluene solution at room temperature.

Refinement

The H atom of the NH group and the H atoms of the water molecule were located in a difference map and later restrained to N–H = 0.86 (2) %A and to O–H = 0.85 (2) %A. The other H atoms were positioned with idealized geometry using a riding model with C–H = 0.93 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

Figures

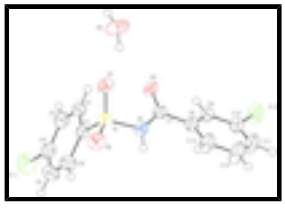

Fig. 1. Molecular structure of the title compound, showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

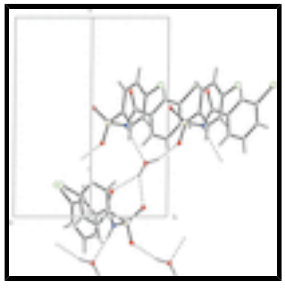

Fig. 2. Part of the crystal packing in the title compound, showing hydrogen bonds (dashed lines) involving the water molecules.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.066$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.184$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.1432P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2511 reflections	$(\Delta/\sigma)_{max} = 0.008$
199 parameters	$\Delta\rho_{max} = 0.49$ e Å^{-3}
3 restraints	$\Delta\rho_{min} = -0.48$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.038; wR factor = 0.105; data-to-parameter ratio = 10.6.

The asymmetric unit of the title compound, $C_{14}H_{14}N_2O_2$, comprises two independent molecules, which slightly differ in the orientation of the propargyl chain. In both molecules, the diazepine ring adopts a boat conformation with the propargyl-bearing C atom as the prow and the C atoms at the ring junction as the stern. The carbonyl O atom of one independent molecule is hydrogen bonded to the acetylenic H atom of the other independent molecule. In the crystal, symmetry-related molecules are linked together by C—H···O hydrogen bonds, forming a ribbon-like structure along the c axis.

1,5-Dimethyl-3-propargyl-1*H*-1,5-benzodiazepine-2,4(3*H*,5*H*)-dione

R. Dardouri, F. Ouazzani Chahdi, N. Saffon, E. M. Essassi and S. W. Ng

Comment

We recently reported the crystal stucture of 1,5-dibenzyl-3-propargyl-1,5-benzodiazepine-2,4-dione, a compound readily synthesized by reacting the disubstituted 1,5-benzodiazepine-2,4-dione with propargyl bromide (Jabli *et al.*, 2009). The background to the study of such compounds is given in other reports. Replacing the benzyl unit by a methyl unit in the present study gives a compoound having a diazepine ring system (Scheme I, Fig. 1). This ring adopts a boat conformation (with the propargyl-bearing C atom as the prow and the fused-ring C atoms as the stern). There are two independent molecules; the acetylenic H-atom of one molecule forms a hydrogen to the carbonyl O-atom of the other independent molecule.

Experimental

To a solution of potassium *t*-butoxide (0.42 g, 3.6 mmol) in DMF (15 ml) was added 1,5-dimethyl-1,5-benzodiazepine-2,4-dione (0.50 g, 2.4 mmol) and propargyl bromide (0.26 ml, 2.87 mmol). Stirring was continued for 24 h. The reaction was monitored by thin layer chromatography. On completion of the reaction, the mixture was filtered; crystals were obtained when the solvent was allowed to evaporate.

Refinement

The acetylenic H atoms were located in a difference Fourier map and were refined with C–H distances restrained to 0.93 (1) Å; their U_{iso} parameters were freely refined. The remaining H atoms were placed in calculated positions (C–H = 0.93–0.98 Å) and were included in the refinement in the riding-model approximation, with U_{iso}(H) set to 1.2–1.5U_{eq}(C). In the absence of significant anomalous scattering effects, 3266 Friedel pairs were averaged.

Figures

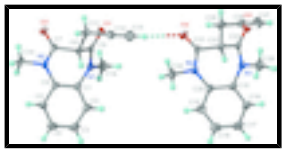

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of the two independent molecules of $C_{14}H_{14}N_2O_2$ at the 50% probability level shown as a hydrogen-bonded dimer; H atoms are drawn as spheres of arbitrary radius. The dashed line denotes a hydrogen bond.

$C_{14}H_{14}N_2O_2$	$F(000) = 1024$
$M_r = 242.27$	$D_x = 1.310$ Mg m^{-3}
Monoclinic, *Cc*	Mo *K*α radiation, λ = 0.71073 Å
Hall symbol: C -2yc	Cell parameters from 5448 reflections

a = 16.0768 (3) Å	θ = 2.5–29.4°
b = 17.1087 (3) Å	μ = 0.09 mm^{-1}
c = 8.9530 (2) Å	T = 293 K
β = 93.701 (1)°	Plate, colourless
V = 2457.42 (8) Å^3	0.40 × 0.30 × 0.05 mm
Z = 8	

Data collection

Bruker X8 APEXII area-detector diffractometer	2637 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	R_{int} = 0.049
graphite	θ_{max} = 30.0°, θ_{min} = 2.8°
φ and ω scans	h = −22→22
21953 measured reflections	k = −24→23
3580 independent reflections	l = −12→12

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.038	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.105	H atoms treated by a mixture of independent and constrained refinement
S = 1.06	$w = 1/[\sigma^2(F_o^2) + (0.0514P)^2 + 0.5357P]$ where $P = (F_o^2 + 2F_c^2)/3$
3580 reflections	$(\Delta/\sigma)_{max}$ = 0.001
337 parameters	$\Delta\rho_{max}$ = 0.22 e Å^{-3}
4 restraints	$\Delta\rho_{min}$ = −0.19 e Å^{-3}

Key indicators: single-crystal X-ray study; T = 223 K; mean σ(C–C) = 0.002 Å; R factor = 0.054; wR factor = 0.145; data-to-parameter ratio = 15.3.

In the title compound, $C_{14}H_{10}F_3N_7\cdot 2CH_4O$, the heterocyclic ring system is essentially planar (r.m.s. deviation = 0.009 Å) and makes a dihedral angle of 6.91 (8)° with the attached benzene ring. In the crystal, the main molecules form centrosymmetric $R_2^2(8)$ dimers *via* pairs of N—H···N hydrogen bonds between the amino groups and pyrimidine N atoms. One of the independent methanol molecules and its inversion equivalent are linked to the dimers *via* O—H···N and N—H···O hydrogen bonds, forming $R_4^4(16)$ graph-set motifs. The dimers along with the hydrogen-bonded methanol molecules are stacked along the *a* axis, with π–π interactions between the pyrazole and triazole rings [centroid–centroid distance = 3.4953 (10) Å].

8-Methyl-2-[4-(trifluoromethyl)phenyl]-8*H*-pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidin-5-amine methanol disolvate

A. V. Dolzhenko, G. K. Tan, A. V. Dolzhenko, L. L. Koh and G. Pastorin

Comment

Pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidine system has been recognized as an excellent template for the construction of new adenosine receptor antagonists (Baraldi *et al.*, 2006; Cacciari *et al.*, 2007). However, information on the structure of this heterocyclic system is limited (Ferretti *et al.*, 2006; Mezheritsky *et al.*, 2004; Tyurin *et al.*, 2005; Xiao & Shi, 2007). In continuation of our works on the development of new pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidine adenosine receptor antagonists (Dolzhenko *et al.*, 2009; Cheong *et al.*, 2010), we report here the molecular and crystal structure of 8-methyl-2-(4-trifluoromethylphenyl)-8*H*-pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidin-5-amine.

The compound crystallizes with two methanol solvent molecules. The heterocyclic ring system is essentially planar with an r.m.s. deviation of 0.009 Å. The phenyl ring makes a dihedral angle of 6.91 (8)° with the pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidine core. The trifluoromethyl group C atom, C13, is located 0.130 (3) Å above the C7—C12 mean plane.

In the crystal, molecules of 8-methyl-2-(4-trifluoromethylphenyl)-8*H*-pyrazolo[4,3-*e*][1,2,4]triazolo[1,5-*c*]pyrimidin-5-amine form centrosymmetric inversion dimers (Fig. 2). The pyrimidine N3 atom is connected with amino group N7—H7B of the pair molecule by intermolecular N···H—N hydrogen bond making $R_2^2(8)$ graph-set motif (Bernstein *et al.*,1995). Methanol hydroxy group O1S—H1S also links the heterocyclic molecules in the dimer by the N—H···O—H···N hydrogen bond array with amino group N7—H7A and N2 of the pyrazole ring making $R_4^4(16)$ graph-set motif. Another methanol molecule forms the O—H···N hydrogen bond with N6 of the triazole ring. The dimers are stacked along the *a* axis, with π–π interactions between pyrazole and triazole rings [centroid-to-centroid distance = 3.4953 (10) Å] (Fig. 2).

Experimental

8-Methyl-2-(4-trifluoromethylphenyl)-8*H*-pyrazolo[4,3-*e*][1,2,4]triazolo][1,5-*c*]pyrimidin-5-amine was prepared from 8-methyl-2-(4-trifluoromethylphenyl)-8*H*-pyrazolo[4,3-*e*][1,2,4]triazolo][1,5-*c*]pyrimidine (Dolzhenko *et al.*, 2009) similarly to the described method (Cheong *et al.*, 2010). The detail procedure will be reported elsewhere. The crystals suitable for crystallographic analysis were grown by recrystallization from methanol. m.p. 573 K.

Refinement

All C-bound H atoms were positioned geometrically and included in the refinement in riding-motion approximation [0.94 Å for CH of aromatic systems, 0.97 Å for methyl groups, and 0.83 Å for hydroxyl groups; $U_{iso}(H) = 1.2U_{eq}(C_{Ar})$ and $U_{iso}(H) = 1.5U_{eq}(O,C_{Me})$] while the amino group H atoms were located in a difference map and refined freely.

Figures

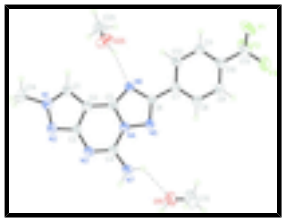

Fig. 1. The asymmetric unit of the title compound, showing the atomic numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

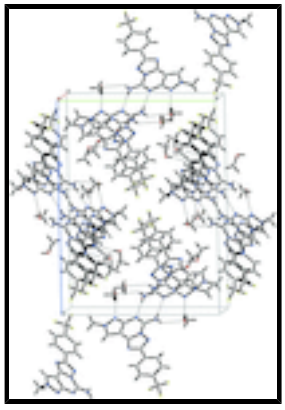

Fig. 2. Crystal packing of the title compound, viewed along the *a* axis.

$V = 1793.93$ (19) Å^3	Block, colourless
$Z = 4$	0.58 × 0.32 × 0.12 mm

Data collection

Bruker SMART APEX CCD diffractometer	4076 independent reflections
Radiation source: fine-focus sealed tube	3538 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.027$
φ and ω scans	$\theta_{max} = 27.5°$, $\theta_{min} = 1.5°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 2001)	$h = -5 \rightarrow 5$
$T_{min} = 0.932$, $T_{max} = 0.985$	$k = -21 \rightarrow 22$

12385 measured reflections	$l = -23 \rightarrow 29$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.054$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.145$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0746P)^2 + 0.7421P]$ where $P = (F_o^2 + 2F_c^2)/3$
4076 reflections	$(\Delta/\sigma)_{max} = 0.001$
266 parameters	$\Delta\rho_{max} = 0.35$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.21$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.049; wR factor = 0.153; data-to-parameter ratio = 20.4.

In the title compound, $C_{21}H_{16}N_2O_3$, the fused-ring system (r.m.s. deviation = 0.067 Å) is slightly buckled at the carbonyl C atom of the anthracenyl ring system [deviation = 0.177 (1) Å] that is closer to an allyl substituent. The two allyl units lie on the same side of the fused-ring plane but are oriented in opposite directions, with N—C—C—C torsion angles of 126.9 (2) and 116.7 (2)°. In the crystal, the molecules are linked into chains propagating along the *b* axis by C—H···O hydrogen bonds.

1,3-Diallyl-1*H*-anthra[1,2-*d*]imidazole-2,6,11(3*H*)-trione

Z. Afrakssou, Y. K. Rodi, H. Zouihri, E. M. Essassi and S. W. Ng

Comment

An imidazol-one such as 1*H*-anthra[2,1-*d*]imidazole-2,6,11(3*H*)-trione, in which the five-membered ring is fused with an anthraquinone system, alkyl halides under catalytic conditions to yield di-*N*,*N*'-substituted derivatives that serve as starting reagents for the synthesis of other drugs. The anthraquinone system itself is found in a large number of pigments and dyes. The title compound (Scheme I, Fig. 1) is a deep orange material that may be useful as an organic fluorophone.

The title molecule features four rings that are fused together (r.m.s. deviation 0.067 Å). The fused-ring system is slightly buckled at that carbonyl C-atom, C3, of the anthracenyl system [0.177 (1) Å] that is closer to an allyl substituent. The pendant allyl units lie on the same side of the fused-ring plane but are oriented in opposite directions. The crystal packing is stabilized by C—H···O hydrogen bonds (Table 1).

Experimental

To a solution of 1*H*-anthra[2,1-*d*]imidazole-2,6,11(3*H*)-trione (1.00 g, 0.38 mmol), potassium carbonate (1.56 g,11 mmol) and tetra *n*-butyl ammonium bromide (0.12 g, 0.38 mmol) in DMF (20 ml)) was added allyl bromide (0.77 ml, 11 mmol). Stirring was continued at room temperature for 24 h. The mixture was filtered and the solvent removed. The residue was extracted with water. The organic compound was chromatographed on a column of silica gel with ethyl acetate-hexane (1/1) as eluent. Orange crystals were isolated when the solvent was allowed to evaporate.

Refinement

H atoms were placed in calculated positions (C–H = 0.93–0.97 Å) and were included in the refinement in the riding model approximation, with U(H) set to 1.2U_{eq}(C).

Figures

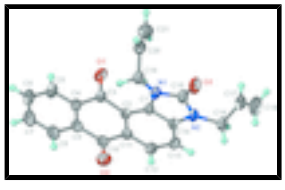

Fig. 1. Displacement ellipsoid plot (Barbour, 2001) of $C_{21}H_{16}N_2O_3$ at the 50% probability leve. H atoms are drawn as spheres of arbitrary radii.

Received 23 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.005 Å; R factor = 0.031; wR factor = 0.110; data-to-parameter ratio = 13.1.

In the title molecule, $C_{17}H_{12}BrN_3O$, the imidazopyridine ring system is almost coplanar with the furan ring [dihedral angle = 2.0 (3)°]. The benzyl phenyl ring is oriented at dihedral angles of 85.2 (2) and 85.5 (1)°, respectively, with respect to the furan ring and the imidazopyridine ring system. In the crystal, molecules are linked into chains propagating along the *b* axis by C—H···N hydrogen bonds. Adjacent chains are linked *via* short Br···Br contacts [3.493 (1) Å].

3-Benzyl-6-bromo-2-(2-furyl)-3*H*-imidazo[4,5-*b*]pyridine

Y. Ouzidan, Y. K. Rodi, H. Zouihri, E. M. Essassi and S. W. Ng

Comment

The imidazo[4,5-*b*]pyridine unit is an important heterocyclic nucleus found in a large number of molecules in medicinal chemistry. Heterocycles derived from such compounds posess useful medicinal properties. Owing to their importance, strategies have been developed for their synthesis. The most popular synthetic approach involves the cyclocondensation of 2,3-pyridinediamine with carboxylic acid derivatives or on condensation with aldehydes. An earlier study reported the crystal structure of 4-benzyl-6-bromo-2-phenyl-4*H*-imidazo[4,5-*b*]pyridine (Ouzidan *et al.*, 2010), which was synthesized by using a much more convenient route. The synthesis is extended to the title compound.

In the title molecule (Scheme and Fig. 1), the imidazopyridine ring system is almost coplanar with the furan ring at the 2-position of the five-membered ring [dihedral angle = 2.0 (3) °]. The molecules are linked into chains along the *b* axis by C—H···N hydrogen bonds (Table 1). The adjacent chains are linked via short Br···Br contacts [3.493 (1) Å].

Experimental

6-Bromo-2-furyl-3*H*-imidazo[4,5-*b*]pyridine (0.30 g, 1.13 mmol) was dissolved in DMF (15 ml). Potassium carbonate (0.2 g, 1,48 mmol), tetra-*n*-butylammonium bromide (0.04 g, 0.1 mmol) and benzyl chloride (0.15 ml, 1.36 mmol) were added. Stirring was continued at room temperature for 12 h. The mixture was filtered and the solvent removed under reduced pressure. The residue was chromatographed on a column of silica gel with ethyl acetate-hexane (1/2) as eluent. The compound was recrystallized from chloroform to give orange crystals.

Refinement

H atoms were placed in calculated positions (C–H = 0.93–0.97 Å) and were included in the refinement in the riding model approximation, with U(H) set to 1.2U_{eq}(C).

Figures

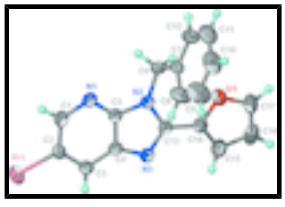

Fig. 1. Displacement ellipsoid plot (Barbour, 2001) of the molecule of $C_{17}H_{12}BrN_3O$ at the 50% probability level. H atoms are shown as spheres of arbitrary radii.

Received 23 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.040; wR factor = 0.129; data-to-parameter ratio = 25.8.

In the title compound, $C_{20}H_{18}Cl_2N_4O_8$, the two pyrimidine rings are inclined at dihedral angles of 66.68 (5) and 71.91 (6)° with respect to the central benzene ring. In the crystal structure, intermolecular C—H···N hydrogen bonds link neighbouring molecules into a ribbon-like structure along the b axis. The ribbons are interconnected into a two-dimensional network parallel to the bc plane by short intermolecular Cl···Cl [3.4427 (6) Å] and Cl···O [3.1420 (9) and 3.1750 (11) Å] interactions. The crystal structure is further stabilized by intermolecular π–π interactions [centroid–centroid distance 3.4552 (8) Å] involving the pyrimidine rings.

Methyl 2,6-bis[(5-chloro-4,6-dimethoxypyrimidin-2-yl)oxy]benzoate

H.-K. Fun, J. H. Goh, S. Rai, A. M. Isloor and P. Shetty

Comment

Methyl-2,6-bis[(5-bromo-4,6-dimethoxypyrimidin-2-yl)oxy]benzoate is a derivative of herbicide showing excellent herbicidal effects on annual and perennial weeds and high-safety crops, especially rice and wheat and is applied to paddy fields, ploughed fields and non-agricultural land (Koichiro *et al.*, 1988, 1998). Most sulphonylurea herbicides and all pyrimidinyl-benzoate herbicides (He *et al.*, 2007) such as nicofulfuron, amidosulfuron, halopyrazosulfuron, ethoxysulfuron, pyriminobac-methyl and pyriftalid, possess 4,6-dimethoxypyrimidin-2-yl groups (Li *et al.*, 2006), while sulfometuron-methyl, a kind of sulfonylurea, contains 4,6-dimethylpyrimidin-2-yl groups, which suggests that the two disubstituted pyrimidin-2-yl groups possess high biological activity (Gerorge, 1983).

In the title compound (Fig. 1), the two pyrimidine rings (C1-C4/N1/N2 and C11-C14/N3/N4) are essentially planar, with maximum deviations of 0.011 (1) and 0.007 (1) Å, respectively, at atoms N1 and N4. The central phenyl ring is inclined at dihedral angles of 66.68 (5) and 71.91 (6)°, respectively, with respect to the C1-C4/N1/N2 and C11-C14/N3/N4 pyrimidine rings. The bond lengths and angles are consistent with a closely related structure (Li & Luo, 2006).

In the crystal structure, intermolecular C16—H16A···N1 and C20—H20A···N3 hydrogen bonds (Table 1) link neighbouring molecules into a ribbon-like structure containing $R^2_2(26)$ ring motifs (Fig. 2, Bernstein *et al.*, 1995), along the *b* axis. The interesting features of the crystal structure are the intermolecular short Cl···Cl [Cl1···Cl2^{iii} = 3.4427 (6) Å; (iii) 1/2-x2, y-1/2, 1/2-z] and Cl···O [Cl1···O8^{iii} = 3.1750 (11) and Cl2···O1^{iv} = 3.1420 (9) Å; (iv) x, 2-y, z+1/2] interactions, which are shorter than the sum of the van der Waals radii of the relevant atoms, interconnecting the ribbons into two-dimensional networks parallel to the *bc* plane. The crystal structure is further stabilized by weak intermolecular π–π interactions [*Cg*1···*Cg*1^{v} = 3.4552 (8) Å; (v) -x, y, -z+1/2; *Cg*1 is the centroid of C11-C14/N3/N4 pyrimidine ring].

Experimental

To a stirred solution of methyl-2,6-dihydroxybenzoate (0.50 g, 0.0026 mol) in acetonitrile (10 ml) was added potassium carbonate (1.00 g, 0.0070 mol) and 5-chloro-4,6-dimethoxy-2-(methylsulfonyl)pyrimidine (1.58 g, 0.0050 mol). The reaction mixture was heated to reflux for 4 h. Mass analysis showed completion of the reaction. The reaction mixture was filtered and the filtrate was concentrated. The residue was recrystallized using dichloromethane to obtain the title compound (yield: 67 %, m.p. 427–430 K).

Refinement

All H atoms were placed in the calculated positions, with C–H = 0.93–0.96 Å, and refined using a riding model with U_{iso} = 1.2 or 1.5 U_{eq}(C). The rotating group model was used for the methyl groups.

Figures

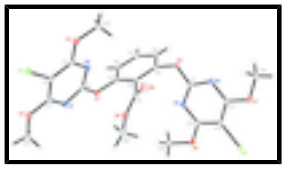

Fig. 1. The molecular structure of the title compound, showing 30 % probability displacement ellipsoids for non-H atoms and the atom-numbering scheme.

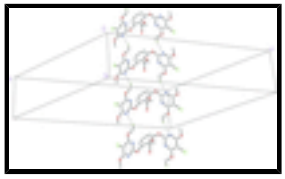

Fig. 2. Part of the crystal structure, viewed along an arbitrary axis, showing a molecular ribbon. H atoms not involved in hydrogen bonds (dashed lines) have been omitted for clarity.

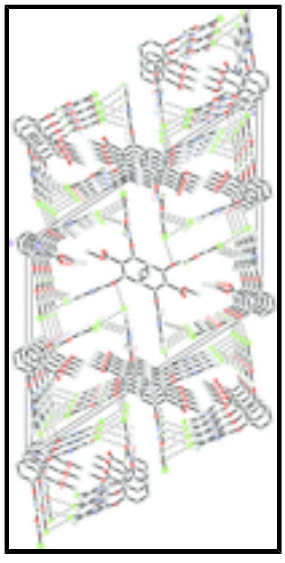

Fig. 3. The crystal structure of the title compound, viewed along the *b* axis, showing two-dimensional networks parallel to the *bc* plane. H atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2$sigma(F^2) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 10 May 2010; accepted 25 June 2010

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.003 Å; R factor = 0.029; wR factor = 0.077; data-to-parameter ratio = 18.1.

In the title compound, $C_{15}H_{10}FIO_2S$, the O atom and the 4-fluorophenyl group of the 4-fluorophenylsulfinyl substituent are located on opposite sides of the plane through the benzofuran fragment; the 4-fluorophenyl ring is nearly perpendicular to this plane, making a dihedral angle of 83.37 (7)°. The crystal structure is stabilized by weak intermolecular C—H···O hydrogen bonds and an I···O interaction [I···O = 3.255 (2) Å]. The crystal structure also exhibits intermolecular C—F···π interactions [3.068 (2) Å], and aromatic π–π interactions between the furan and benzene rings of neighbouring benzofuran fragments [centroid–centroid distance = 3.636 (2) Å].

3-(4-Fluorophenylsulfinyl)-5-iodo-2-methyl-1-benzofuran

H. D. Choi, P. J. Seo, B. W. Son and U. Lee

Comment

Molecules containing benzofuran skeleton show variouspharmacological properties such as antifungal (Aslam *et al.*, 2006), antitumor and antiviral (Galal *et al.*., 2009), antimicrobial (Khan *et al.*., 2005) activity, and these compounds widely occur in nature (Akgul & Anil, 2003; Soekamto *et al.*., 2003). As a part of our ongoing studies of the effect of side chain substituents on the solid state structures of 3-(4-fluorophenylsulfinyl)-2-methyl-1-benzofuran analogues (Choi *et al.*., 2010*a,b,c*), we report the crystal structure of the title compound (Fig. 1).

The benzofuran unit is essentially planar, with a mean deviation of 0.008 (2) Å from the least-squares plane defined by the nine constituent atoms. The 4-fluorophenyl ring is almost perpendicular to the plane of the benzofuran fragment [83.37 (7)°] and is tilted slightly towards it. The crystal packing (Fig. 2) is stabilized by weak intermolecular C—H···O hydrogen bonds; the first one between the benzene H atom and the furan O atom with a C5—H5···O1^{i}, and the second one between the methyl H atom and the oxygen of the S═O unit, with a C9—H9C···O2^{ii}, respectively (Table 1). The molecular packing (Fig. 2) is also stabilized by an I···O halogen bonding between the iodine and the oxygen of the S═O unit [I···O2^{v} = 3.255 (2) Å; C4—I···O2^{v} = 164.42 (8)°] (Politzer *et al.*, 2007). The crystal packing (Fig. 3) also exhibits intermolecular C—F···π interactions between the fluorine and the benzene ring of an adjacent benzofuran system, with a C13—F···Cg2^{vii} distance of 3.068 (2) Å (Cg2 is the centroid of the C2–C7 benzene ring), and aromatic π–π interactions between the furan and the benzene rings of the adjacent benzofuran systems, with a Cg1···Cg2^{viii} distance of 3.636 (2) Å (Cg1 is the centroid of the C1/C2/C7/O1/C8 furan ring).

Experimental

77% 3-Chloroperoxybenzoic acid (166 mg, 1.0 mmol) was added in small portions to a stirred solution of 3-(4-fluorophenyl-sulfanyl)–5-iodo-2-methyl-1-benzofuran (346 mg, 0.9 mmol) in dichloromethane (30 mL) at 273 K. After being stirred at room temperature for 3h, the mixture was washed with saturated sodium bicarbonate solution and the organic layer was separated, dried over magnesium sulfate, filtered and concentrated at reduced pressure. The residue was purified by column chromatography (hexane–ethyl acetate, 1:1 v/v) to afford the title compound as a colorless solid [yield 77%, m.p. 428–429 K; R_f = 0.64 (hexane–ethyl acetate, 1:1 v/v)]. Single crystals suitable for X-ray diffraction were prepared by slow evaporation of a solution of the title compound in benzene at room temperature.

Refinement

All H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 Å for aryl and 0.96 Å for methyl H atoms. U_{iso}(H) = 1.2U_{eq}(C) for aryl and 1.5U_{eq}(C) for methyl H atoms.

Figures

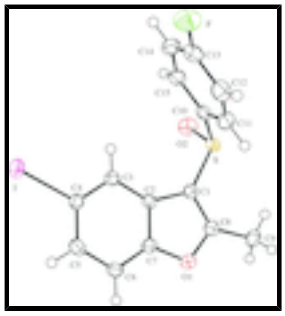

Fig. 1. The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are presented as a small spheres of arbitrary radius.

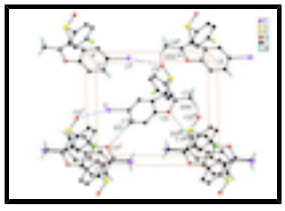

Fig. 2. C—H···O and I···O interactions (dotted lines) in the crystal structure of the title compound. [Symmetry codes: (i) - *x* + 2, *y* - 1/2, - *z* + 3/2; (ii) *x*, - *y* + 3/2, *z* + 1/2; (iii) - *x* + 2, *y* + 1/2, - *z* + 3/2; (iv) *x*, - *y* + 3/2, *z* - 1/2; (v) *x*, - *y* + 1/2, *z* + 1/2; (vi) *x*, - *y* + 1/2, *z* - 1/2.]

$w = 1/[\sigma^2(F_o^2) + (0.0381P)^2 + 1.2193P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$
$\Delta\rho_{max}$ = 0.57 e Å^{-3}
$\Delta\rho_{min}$ = −1.56 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2$sigma(F^2) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

(2*R**,6*S**)-*tert*-Butyl 2,6-bis(hydroxymethyl)morpholine-4-carboxylate

Qian Chen,[a] Bojun Li[b] and Guangxin Xia[b]*

[a]Shanghai Institute of Materia Medica, Chinese Academy of Sciences, Shanghai 201203, People's Republic of China, and [b]Central Research Institute, Shanghai Pharmaceutical Group Co. Ltd, 555 Zuchongzhi Road, Shanghai 201203, People's Republic of China
Correspondence e-mail: jkshen@mail.shcnc.ac.cn

Received 15 April 2010; accepted 13 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; disorder in main residue; R factor = 0.066; wR factor = 0.199; data-to-parameter ratio = 14.3.

In the title compound, $C_{11}H_{21}NO_5$, the H atoms of the hydroxy groups are disordered over two positions, each in a 1:1 ratio. In the crystal, intermolecular O—H···O hydrogen bonds link pairs of molecules into centrosymmetric dimers. Weak intermolecular O—H···O interactions further link these dimers into chains extended in the [100] direction.

Comment

Morpholine and its derivatives have been widely investigated (Lupi *et al.*, 2004; Dave &Sasaki, 2004) due to their importance in the search of new therapeutically and biologically active compounds. In the present paper, we report the crystal structure of the title compound, (I).

In (I) (Fig. 1), the H atoms of two hydroxy groups are disordered over two positions each in a ratio 1:1. In the crystal, intermolecular O—H···O hydrogen bonds (Table 1) link two molecules into centrosymmetric dimer. Weak intermolecular O—H···O interactions [O···O 3.269 (4) Å] (Table 1) link further these dimers into chains extended in direction [100].

Experimental

A mixture of (*S*)-(+)-benzyl glycidyl ether(9.84 g,60 mmol) and benzylamine(3.21 g,30 mmol) was heated with stirring at 60 centidegrees for 16 h. After being cooled to room temperature, an oil crude product (A) was obtained. Under ice-bath cooling, compound A (4.36 g,10 mmol) was dissolved in dry tetrahydrofuran (90 mL), 60% NaOH (1.0 g,25 mmol) was added over 15 minutes. The reaction mixture was stirred at 0 centidegrees for 30 minutes.Then a solution of TsCl(1.9 g,10 mmol) in dry THF(10 mL) was added dropwise over 30 minutes. After 10 min the solution was allowed to react at rt for 30 minutes and then heated at 50 centidegree until complete (usually about 2 h). After addition of an appropriate volume of 100 mL water, the aqueous layer was extracted three times with ethyl ether (30 mL). The combined organic layers were dried over anhydrous sodium sulfate and the solvent was removed and gave a yellow oil product(II). A solution of product II(2.09,5 mm mol) and acetic acid(10 mL) in methanol (30 mL) was treated with 10%Pd/C(200 mg) and then hydrogenated until complete(24 h). The catalyst was filtered and the solvent removed under reduced pressure.The pure product(III) was obtained. Product III was reacted with Boc anhydride to gave the target product. The target product was recrystallized from dry ether. Colourless crystals suitable for single crystal X-ray diffraction were obtained.

Refinement

H atoms bonded to O2 and O3 were each positioned in two possible idealized positions with occupancies fixed to 0.5, and were isotropically refined with the O—H bond length restrained to 0.82 (3) Å. C-bound H atoms were geometrically positioned (C—H = 0.96-0.98 Å) and treated as riding, with U_{iso}(H)=1.2-1.5 U_{eq}(C).

Figures

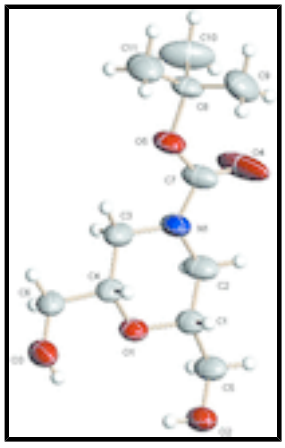

Fig. 1. The molecular structure of (I) showing the atomic numbering and 30% probability displacement ellipsoids. For each of two disordered H atoms (bound to O2 and O3) only one position is shown.

(2*R**,6*S**)-*tert*-Butyl 2,6-bis(hydroxymethyl)morpholine-4-carboxylate

Crystal data

$C_{11}H_{21}NO_5$	$F(000) = 1072$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.066$	Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.199$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0978P)^2 + 0.9544P]$ where $P = (F_o^2 + 2F_c^2)/3$
2476 reflections	$(\Delta/\sigma)_{max} = 0.028$
173 parameters	$\Delta\rho_{max} = 0.53$ e Å^{-3}
4 restraints	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes. Refinement. Refinement of F2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F2. The threshold expression of F2 > σ(F2) is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 27 April 2010; accepted 27 May 2010

Key indicators: single-crystal X-ray study; T = 294 K; mean σ(C–C) = 0.008 Å; R factor = 0.062; wR factor = 0.210; data-to-parameter ratio = 13.7.

In the thioglycoluril system of the title compound, $C_{32}H_{30}N_8S_2\cdot CHCl_3$, the two pyridine rings are roughly parallel, forming a dihedral angle of 7.2 (1)°, and the distance between the centroids of the two phenyl rings is 3.951 (5) Å. The chloroform solvent molecule is linked to the main molecule *via* a weak C—H···N hydrogen bond.

Comment

Recently, molecular clips based on concave glycoluril unit have been widely investigated in supramolecular chemistry (Rowan *et al.*, 1999). We report here the structure of the title compound (Fig. 1), which is a derivative of thioglycoluril with two pyridine units. We believe the title compound would offer the possibility in construction of coordination framework with novel patterns (Li *et al.*, 2008). The crystal packing exhibits weak intermolecular C—H···N hydrogen bond (Table 1) between the chloroform solvent molecule and the main molecule.

Experimental

The title compound was synthesized according to the literature (Broan *et al.*, 1989; Li *et al.*, 2008). Crystals of (I) suitable for X-ray diffraction were grown by slow evaporation of a chloroform-methanol (1:2) solution of the title compound under 293 K.

Refinement

All H atoms were positioned in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances in the range 0.93-0.98 Å and $U_{iso}(H) = 1.2\text{-}1.5U_{eq}(C)$. The low ratio observed/unique reflections (0.38) was mainly caused by poor quality of the crystal selected for measurements.

Figures

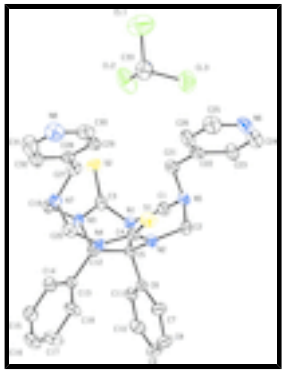

Fig. 1. A view of (I), showing the atom-labelling scheme, with displacement ellipsoids drawn at the 30% probability level.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.062	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.210	H-atom parameters constrained
S = 0.85	$w = 1/[\sigma^2(F_o^2) + (0.1041P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
5690 reflections	$(\Delta/\sigma)_{max}$ = 0.001
415 parameters	$\Delta\rho_{max}$ = 0.47 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.39 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger. Because of the poor quality of crystal, the ratio of Observed/Unique Reflections is 38%.

Received 7 May 2010; accepted 15 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; disorder in main residue; R factor = 0.066; wR factor = 0.240; data-to-parameter ratio = 23.1.

In the title compound, $C_{11}H_{18}N_2^{2+}\cdot 2ClO_4^-\cdot H_2O$, one perchlorate anion is disordered over two orientations in a 0.66 (3):0.34 (3) ratio. Intermolecular O—H···O, N—H···O and C—H···O hydrogen bonds link the cations, anions and water molecules into ribbons extending along [100].

1-Benzylpiperazine-1,4-diium bis(perchlorate) monohydrate

K. Kaabi, M. El Glaoui, E. Jeanneau, M. Rzaigui and C. Ben Nasr

Comment

Chemists and physicists of the solid state have shown an increasing interest in the study of perchlorate salts containing organic cations in recent years owing to their great interesting properties such as ferroelectric and dielectric behaviours. (Czarnecki *et al.*, 1994; Czupinski *et al.*, 2002; Czupinski *et al.*, 2006). Here, we report the synthesis and the crystal structure of the title compound (I), $[C_{11}H_{18}N_2]^{2+}.2ClO_4^-.H_2O$.

The crystal structure of (I) (Fig.1), contains two ClO_4^- anions, a 1-benzylpiperazine-1,4-diium dication and a water molecule. In its atomic arrangement, the ClO_4^- anions are associated per pair *via* O—H···O hydrogen bonds generated by a water molecule to form $[Cl_2O_8H_2O]^{2-}$ entities. The 1-benzylpiperazine-1,4-diium dications are associated to these entities and connected them through N—H···O and C—H···O hydrogen bonds, leading to the formation of three dimensional network. As expected, the ClO_4 anion has typical tetrahedral geometry where the Cl—O bond lengths and O—Cl—O angles are not equal to one another but very with the environment around the O atoms. In the title compound, the Cl—O bond lengths vary from 1.382 (12) Å to 1.437 (7) Å for $Cl1O_4$ anion and from 1.374 (3) Å to 1.484 (4) Å for $Cl2O_4$anion. The O—Cl—O angles range from 104.2 (14) ° to 119.3 (15) ° for the first anion and from 103.1 (2) °. to 118.4 (2) ° for the second one. These values clearly indicate that the coordination geometry of the Cl atom can be regarded as being a distorted tetrahedron. However, for $Cl2O_4$ tetrahedron all the oxygen atoms are involved in hydrogen bonds, while only three oxygen atoms acts as acceptors of hydrogen bonds for the $Cl1O_4$ tetrahedron.

Refinement

All H atoms were located in a difference map, but those attached to carbon atoms were repositioned geometrically. The H atoms were initially refined with soft restraints on the bond lengths and angles to regularize their geometry (C—H in the range 0.93–0.98, N—H in the range 0.86–0.89 N—H to 0.86 O—H = 0.82 Å) and U_{iso}(H) (in the range 1.2–1.5 times U_{eq} of the parent atom), after which the positions were refined with riding constraints. The rotational disorder observed for one perchlorate anion (with Cl1) was modelized using two superimposed molecules with partial occupancies. The molecules were then refined with restraints on the Cl—O bonds, O—Cl—O angles and displacement parameters of the oxygen atoms

Figures

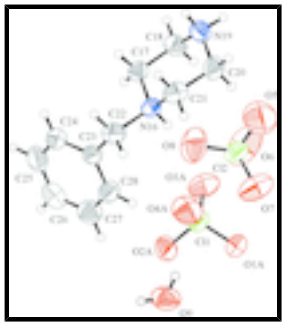

Fig. 1. View of (I), showing 50% probability displacement ellipsoids and arbitrary spheres for the H atoms. For the disordered perchlorate anion, only major part is shown.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.066$	H-atom parameters constrained

$wR(F^2) = 0.240$	$w = 1/[\sigma^2(F_o^2) + (0.15P)^2 + 0.05P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.12$	$(\Delta/\sigma)_{max} < 0.001$
5885 reflections	$\Delta\rho_{max} = 1.04$ e Å^{-3}
255 parameters	$\Delta\rho_{min} = -0.88$ e Å^{-3}
40 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.062 (11)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Received 9 May 2010; accepted 27 May 2010

Key indicators: single-crystal X-ray study; T = 290 K; mean σ(C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.111; data-to-parameter ratio = 17.6.

The asymmetric unit of the title compound, $C_{23}H_{26}N_2$, contains one half-molecule, which is completed by the operation of a crystallographic twofold axis. In the molecule, the two benzene rings form a dihedral angle of 77.09 (7)°.

2,2',6,6'-Tetraethyl-4,4'-methylenedibenzonitrile

J. Yuan and Y. Zhu

Comment

Aromatic nitriles are important intermediates in the synthesis of pharmaceuticals, agrochemicals, herbicides, dyes and pigments, and serve as precursors for many useful compounds including benzoic acid derivatives, benzylamines, benzaldehydes, and heterocycles (Debasree *et al.*, 2009; Lal Dhar *et al.*, 2009; Ren *et al.*, 2009; Zhou *et al.*, 2009).

In this paper, we report the synthesis and crystal structure of the title compound (Fig. 1). In the molecule, two benzene rings form a dihedral angle of 77.09 (7)°, and N···N separation is 11.67 (3)Å. The crystal packing doesn't exhibit hydrogen bonds or classical interactions.

Experimental

The title compound has been synthesized following the known procedure (Donald *et al.*, 1955). To an ice-bath cooled solution of 4,4'-methylenebis(2,6-diethylaniline) and sodium nitrite in water was added dropwise concentrated hydrogen chloride, keeping the temperature at 0-5^{o}C for 30 minutes. Then added potassium iodide into the mixed solution, and the white solid bis(3,5-diethyl-4-iodophenyl)methane was obtained. It reacted with cyanocopper in DMF solution at 180^{o}C for 1 hour, then the title compound was obtained. X-ray quality crystal of the title compound was obtained by slow evaporation from chloroform solution at room temperature.

Figures

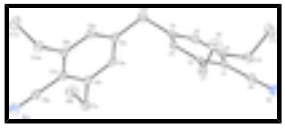

Fig. 1. A view of (I), showing the atom-labelling scheme and 40% probability displacement ellipsoids [symmetry code: (a) -x, y, 1/2-z]. H atoms omitted for clarity.

Crystal data

$C_{23}H_{26}N_2$	$F(000) = 712$
$M_r = 330.46$	$D_x = 1.166$ Mg m^{-3}
Monoclinic, $C2/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -C 2yc	Cell parameters from 2049 reflections
$a = 16.016$ (3) Å	$\theta = 2.2$–$23.2°$
$b = 9.3218$ (19) Å	$\mu = 0.07$ mm^{-1}
$c = 13.977$ (3) Å	$T = 290$ K
$\beta = 115.55$ (3)°	Block, colourless
$V = 1882.6$ (7) Å^3	0.16 × 0.10 × 0.10 mm

$Z = 4$

Data collection

Bruker SMART 4K CCD area-detector diffractometer	1405 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.028$
graphite	$\theta_{max} = 27.0°$, $\theta_{min} = 3.2°$
phi and ω scans	$h = -20 \rightarrow 20$
8636 measured reflections	$k = -11 \rightarrow 11$
2055 independent reflections	$l = -17 \rightarrow 17$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.038$	H-atom parameters constrained
$wR(F^2) = 0.111$	$w = 1/[\sigma^2(F_o^2) + (0.0506P)^2 + 0.6433P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.16$	$(\Delta/\sigma)_{max} = 0.003$
2055 reflections	$\Delta\rho_{max} = 0.24$ e Å^{-3}
117 parameters	$\Delta\rho_{min} = -0.20$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0066 (13)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 9 May 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.003 Å; disorder in main residue; R factor = 0.047; wR factor = 0.116; data-to-parameter ratio = 17.0.

The asymmetric unit of the title compound, $C_{30}H_{34}N_4O_6$, contains two independent molecules. In one independent molecule, the two ethoxycarbonyl groups are each disordered over two conformations with occupancy ratios of 0.586 (2):0.414 (2) and 0.508 (2):0.492 (2). The crystal packing exhibits weak intermolecular C—H···O hydrogen bonds.

Comment

Glycoluril and its derivatives are widely used as building blocks for studies of self-assembly in homogeneous solution (Freeman *et al.*, 1981; Rebek, 2005; Rowan *et al.*, 1999; Wu *et al.*, 2002). As a part of our ongoing investigation into glycoluril derivatives (Wang *et al.*, 2006), here we report the structure of the title compound (I) (Fig. 1).

The asymmetric unit of (I) contains two independent molecules. In one independent molecule, two ethoxy carbonyl groups are disordered over two conformations each with ratios 0.586 (2)/0.414 (2) and 0.508 (2)/0.492 (2), respectively. The crystal packing exhibits weak intermolecular C—H···O hydrogen bonds (Table 1).

Experimental

The title compound was synthesized according to the reported method (Wang *et al.*; 2006). Crystals of (I) suitable for X-ray diffraction were grown by slow evaporation of a dichloromethane-methanol (4:1) solution of the title compound under 293 K.

Refinement

All H-atoms were positioned geometrically and constrained to ride on their parent atoms, with d(C—H) = 0.97 Å, Uĩso~ = 1.2U~eq~ (C) for CH~2~ and d(C—H) = 0.96 Å, Uĩso~ = 1.5U~eq~ (C) for CH~3~ atoms. In one independent molecule, two ethoxy carbonyl groups were treated as disordered over two conformations. The occupancies of the disordered positions C15A/ C15', C16A/ C16', O3A/O3' and O4A/O4' were refined to 0.508 (2) / 0.492 (2), while those for C19A/ C19', C20A/ C20', O5A/O5' and O6A/O6' were refined to 0.414 (2) / 0.586 (2).

Figures

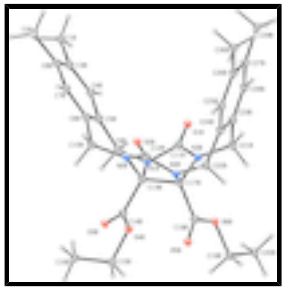

Fig. 1. A view of (I), showing one independent molecule with the atom-labelling scheme and 30% probability displacement ellipsoids.

Diethyl 7,8,18,19-tetramethyl-2,13- dioxohexacyclo[10.10.2.0^{3,24}.0^{5,10}.0^{14,23}.0^{16,21}]tetracosa- 5,7,9,16,18,20-hexaene-23,24-dicarboxylate

Crystal data

13767 independent reflections	$l = -28\rightarrow28$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.116$	H-atom parameters constrained
$S = 0.86$	$w = 1/[\sigma^2(F_o^2) + (0.0539P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
13767 reflections	$(\Delta/\sigma)_{max} = 0.002$
809 parameters	$\Delta\rho_{max} = 0.17$ e Å^{-3}
20 restraints	$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Bis[*N*,*N*-bis(2-hydroxyethyl)glycinato]-cobalt(II)

Jiong-Peng Zhao and Fu-Chen Liu*

School of Chemistry and Chemical Engineering, Tianjin University of Technology, Tianjin 300191, People's Republic of China
Correspondence e-mail: fuchenliutj@yahoo.com

Received 19 May 2010; accepted 19 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.006 Å; R factor = 0.057; wR factor = 0.159; data-to-parameter ratio = 17.2.

The asymmetric unit of the title compound, $[Co(C_6H_{12}NO_4)_2]$, contains one half-molecule with the Co^{II} ion situated on an inversion center. Intermolecular O—H···O hydrogen bonds generate a three-dimensional hydrogen-bonding network, which consolidates the crystal packing.

Bis[*N*,*N*-bis(2-hydroxyethyl)glycinato]cobalt(II)

J.-P. Zhao and F.-C. Liu

Comment

As a contribution to a structural study of ML_2 complexes, where *L* = N,N-bis(2-hydroxyethyl)glycinato ligand, and M = Cu (Ammar *et al.*, 2001; Thakuria & Das, 2007) and Ni (Chuklanova *et al.*, 1981), herewith we report the crystal structure of the title compound CoL_2 (I).

In (I) (Fig. 1), the Co(II) ions are located on the inversion centers and are coordinated by two *L* ligands forming an octahedral enviromental geometry with four oxygen and two nitrogen atoms. The bond lengths are: Co1—N1 = 2.172 (3) Å, Co1—O2 = 2.088 (3) Å and Co1—O4 = 2.046 (2) Å. Though ML_2 complexes (M = Co, Ni, Cu) have similar structures, there are some differences. The Co and Ni centers are in a regular octahedron coordinated geometry, while the Cu center has an elongated octahedral coordination with two hydroxy atoms in axial positions.

Intermolecular O—H···O hydrogen bonds (Table 1) generate three-dimensional hydrogen-bonding network, which consolidate the crystal packing (Fig. 2).

Experimental

A mixture of Co(II) nitrate (1.0mmol), Dy(III)nitrate (0.5mmol) and N,N-bis(2-hydroxyethyl)glycine, (1 mmol), in 10 ml solvent wITH DMF:MeOH = 1:1 was sealed in a Teflon-lined stainless-steel Parr bomb that was heated at 413 K for 48 h. Red crystals of the title complex were collected after the bomb was allowed to cool to room temperature.Yield 20% based on metal salt.

Refinement

C-bound H atoms were included in calculated positions and treated as riding on their parent atoms, with C—H = 0.93Å and U_{iso}(H) = 1.2U_{eq}(C). Hydroxy H atoms were located on difference Fourier maps, but placed in idealized positions (O—H = 0.85Å) and refined as riding, with U_{iso}(H) = 1.2U_{eq}(O).

Figures

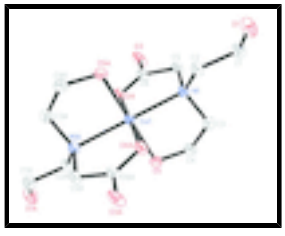

Fig. 1. The molecular structure of the title complex. Displacement ellipsoids are drawn at the 30% probability level. H atom have been omitted for clarity. Symmetry code: (A) -x+1, -y-1, -z+1.

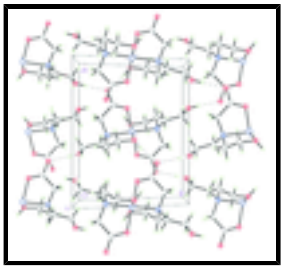

Fig. 2. A portion of the crystal packing viewed down the *c* axis. Dashed lines denote O—H···O hydrogen bonds.

Bis[*N*,*N*-bis(2-hydroxyethyl)glycinato]cobalt(II)

Crystal data

$[Co(C_6H_{12}NO_4)_2]$	$F(000) = 402$
$M_r = 383.26$	$D_x = 1.609$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 9.932$ (2) Å	Cell parameters from 7077 reflections
$b = 11.388$ (2) Å	$\theta = 3.4$–$27.6°$
$c = 7.4477$ (15) Å	$\mu = 1.13$ mm^{-1}
$\beta = 110.12$ (3)°	$T = 293$ K
$V = 791.0$ (3) Å^3	Block, red
$Z = 2$	0.2 × 0.18 × 0.18 mm

Data collection

Rigaku SCXmini diffractometer	1819 independent reflections
Radiation source: fine-focus sealed tube	1357 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.072$
ω scans	$\theta_{max} = 27.5°$, $\theta_{min} = 3.4°$
Absorption correction: multi-scan (*ABSCOR*; Higashi, 1995)	$h = -12 \rightarrow 12$
$T_{min} = 0.736$, $T_{max} = 1.000$	$k = -14 \rightarrow 14$
8129 measured reflections	$l = -9 \rightarrow 9$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.057$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.159$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.1P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
1819 reflections	$(\Delta/\sigma)_{max} < 0.001$
106 parameters	$\Delta\rho_{max} = 0.48$ e Å^{-3}

0 restraints $\Delta\rho_{min} = -0.36$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 21 May 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 113 K; mean σ(C–C) = 0.007 Å; R factor = 0.030; wR factor = 0.067; data-to-parameter ratio = 12.3.

In the title molecule, $C_{21}H_{14}ClFIN_3O$, the bicyclic ring system has a twisted conformation; the two fused rings form a dihedral angle of 4.5 (1)°. The dihedral angles between the fused ring system and the benzene rings are 27.3 (6) and 5.3 (5)° while the dihedral angle between the benzene rings is 22.0 (5)°. In the crystal structure, weak intermolecular N—H···N hydrogen bonds link the molecules into chains propagating in [100]. A short intermolecular distance of 3.806 (3) Å between the centroids of the fluorobenzene and iodobenzene rings suggests the existence of π–π stacking interactions.

Comment

The title compound (I) is an important intermediate in the preparation of anticancer agent lapatinib (Kimberly *et al.*, 2006). Herein, the synthesis and the crystal structure of (I) are reported.

In (I) (Fig. 1), all bond lengths and angles are normal and comparable with those observed in the related compound (Calestani *et al.*, 2001). The bicycle quinazoline system has a twisted conformation - two fused rings form a dihedral angle of 4.5 (1)°. In the crystal structure, weak intermolecular N—H···N hydrogen bonds (Table 1) link molecules into chains propagated in direction [100]. Short intermolecular distance of 3.806 (3) Å between the centroids of aromatic rings suggests an existence of π-π interactions.

Experimental

2-Chloro-4-(6-iodo-quinazolin-4-ylamino)-phenol (10 mmol) in acetone (5 ml) was added to a stirred mixture of anhydrous potassium carbonate (20 mmol) and 1-Chloromethyl-3-fluoro-benzene (10 mmol) in dry acetone (25 ml). It was stirred at room temperature for 6 h. Upon completion reaction mixture was diluted with water, extracted with dichloromethane and concentrated. Recrystallization from ethyl acetate afforded title compound in 89% yield as yellow crystal: 1H NMR (DMSO-d6): 9.82 (1*H*, s, NH), 8.94(1*H*, s, ArH), 8.60(1*H*, s, ArH), 8.08(1*H*, dd, ArH), 8.01(1*H*, d ArH), 7.72 (1*H*, dd ArH), 7.49(1*H*, d ArH), 7.43 (1*H*, dd ArH), 7.19 (3*H*, m ArH), 7.14 (1*H*, t ArH), 5.24(2*H*, s CH2).

Refinement

All H atoms were initially located in a difference Fourier map. C-bound H atoms were then constrained to an ideal geometry (C—H 0.93 Å), N-bound H atom was refined with N—H bond restraint of 0.83 (5) Å. All H-atoms were refined with U_{iso}(H) = 1.2U_{eq}(C,*N*).

$C_{21}H_{14}ClFIN_3O$ $F(000) = 992$

M_r = 505.70	D_x = 1.775 Mg m^{-3}
Orthorhombic, $Pca2_1$	Mo $K\alpha$ radiation, λ = 0.71073 Å
Hall symbol: P 2c -2ac	Cell parameters from 7022 reflections
a = 13.128 (3) Å	θ = 1.1–27.9°
b = 7.6293 (15) Å	μ = 1.86 mm^{-1}
c = 18.898 (4) Å	T = 113 K
V = 1892.8 (7) Å^3	Prism, colourless
Z = 4	0.20 × 0.18 × 0.06 mm

Data collection

Rigaku Saturn CCD area-detector diffractometer	3183 independent reflections
Radiation source: fine-focus sealed tube	2510 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.045
Detector resolution: 14.63 pixels mm^{-1}	θ_{max} = 25.0°, θ_{min} = 3.1°
ω scan	h = −15→15
Absorption correction: multi-scan (*ABSCOR*; Higashi, 1995)	k = −8→9
T_{min} = 0.707, T_{max} = 0.897	l = −21→22
11905 measured reflections	

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)]$ = 0.030	$w = 1/[\sigma^2(F_o^2) + (0.0292P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2)$ = 0.067	$(\Delta/\sigma)_{max}$ = 0.001
S = 1.00	$\Delta\rho_{max}$ = 1.24 e Å^{-3}
3183 reflections	$\Delta\rho_{min}$ = −0.70 e Å^{-3}
258 parameters	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
1 restraint	Extinction coefficient: 0.0309 (8)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 1433 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: −0.039 (19)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.027; wR factor = 0.071; data-to-parameter ratio = 17.1.

The title salt, $C_8H_{10}N_5^+\cdot Br^-$, crystallizes with two independent structural units in the asymmetric unit. The two independent cations have different conformations, the triazole and phenyl rings forming dihedral angles of 32.57 (6) and 52.27 (7)°. In both cations, the amino groups are planar (the sum of the angles at the N atom of each amino group is 360°) and conjugated with the triazole ring. Intermolecular N—H···N and N—H···Br hydrogen bonds consolidate the crystal packing.

3,5-Diamino-1-phenyl-1,2,4-triazolium bromide

V. M. Chernyshev, A. V. Astakhov, V. V. Ivanov and Z. A. Starikova

Comment

1-Substituted 3,5-diamino-1,2,4-triazoles are employed as convenient models for investigating the reactions of *C*-amino-1,2,4-triazoles with electrophiles so far as their molecules contain two amino groups having greatly varied nucleophilicity in positions 3 and 5 of triazole cycle (Chernyshev *et al.*, 2005, 2008, 2010). Relatively high reactivity toward electrophiles allows to use 1-substituted 3,5-diamino-1,2,4-triazoles as starting materials for the selective synthesis of 1,2,4-triazole derivatives and annulated heterocycles (Dunstan *et al.*, 1998; Chernyshev *et al.*, 2006, 2009, 2010). Some contradictions concerning the direction of several reactions of these compounds with electrophiles are present in the literature. For example, it was reported that quaternization of 1-substituted 3,5-diamino-1,2,4-triazoles by alkyl halides (Steck *et al.*, 1958) resulted in formation of 1,2-disubstituted 3,5-diamino-1,2,4-triazolium salts (Fig. 1). However these data are in contrast with quantum chemical calculations and synthetic experiments according to which the quaternization of 1-substituted 3-amino-1,2,4-triazoles as well as 1-substituted 5-amino-1,2,4-triazoles occurs at the atom N4 of triazole cycle (Anders *et al.*; 1997). While studying the quaternization of 2-amino-4,5,6,7-tetrahydro-[1,2,4]triazolo[1,5-*a*]pyrimidines (Chernyshev *et al.*, 2008), which are analogous to 1-substituted 3,5-diamino-1,2,4-triazoles in most of reactions with electrophiles, we found that alkylation takes place at the atom N4 of triazole cycle (a prevailing product) and at the C3-amino group (a minor product). The quantum chemical calculations predict that the direction of protonation and quaternization of 1-substituted *C*-amino-1,2,4-triazoles should be identical (Anders *et al.*, 1997). Therefore protonation can be used as model reaction for investigation of quaternization of 1-substituted 3,5-diamino-1,2,4-triazoles by alkyl halides. It should be noted that the data concerning the crystal structure of salts of 1-substituted *C*-amino-1,2,4-triazoles with proton acids were absent in the Cambridge Structural Database so far (Allen, 2002). Here we report the crystal structure of the title compound, 1-phenyl-1*H*-1,2,4-triazole-3,5-diamine hydrobromide (Fig. 2). The crystals of this compound were surprisingly obtained in attempting to grow the crystal of 3-amino-5,7-dimethyl-2-phenyl-[1,2,4]triazolo[4,3-*a*]pyrimidin-2-ium bromide, suitable for X-ray investigation, from water-acetonitrile. Obviously, the starting triazolopyrimidine gradually hydrolyzed to the 1-phenyl-1*H*-1,2,4-triazole-3,5-diamine hydrobromide and 2,4-pentanedion. It indicates that 1-substituted [1,2,4]triazolo[4,3-*a*]pyrimidin-2-ium salts are inclined to hydrolyze even at room temperature (Fig. 3).

According to our X-ray investigation, the asymmetric unit of the crystal structure consists of two crystallographically independent cations further denoted as the cation A (N1N2C3··· *etc*.) and the cation B (N1'N2'C3'··· *etc*.), and two bromide anions (Br1 and Br2). The cations A and B somewhat differ in bond lengths and mutual orientation of benzene and triazole rings. The dihedral angle between the benzene and triazole cycles is 32.57 (6)° in the cation A whereas that is 52.27 (7)° in the cation B. The triazole cycle is planar in both cations (the deviation of atoms from the mean-square planes does not exceed 0.008 (2) Å). As with the other salts of *C*-amino-1,2,4-triazoles (Reck *et al.*, 1982; Lynch *et al.*, 1998, 1999; Baouab *et al.*, 2000; Bichay *et al.*, 2006; Guerfel *et al.*, 2007; Matulková *et al.*, 2007), the acid proton is attached to the atom N4, amino groups are planar and conjugated with the π-system of triazole cycle. In contrast to the unprotonated 3,5-diamino-1,2,4-triazole (Starova *et al.*, 1980) and alkyl derivatives of 3,5-diamino-1-phenyl-1,2,4-triazole (Dunstan *et al.*, 1998), in the cations A and B the C5—N1 and C3—N2 bonds are shorter than the C3—N4 and C5—N4 bonds. An analogous regularity is observed for the majority of other salts of *C*-amino-1,2,4-triazoles (Reck *et al.*, 1982; Lynch *et al.*, 1998, 1999;

Baouab *et al.*, 2000; Bichay *et al.*, 2006; Guerfel *et al.*, 2007; Matulková *et al.*, 2007). Thus, the majority of protonated *C*-amino-1,2,4-triazoles should be considered as derivatives of 4*H*-1,2,4-triazol-1-ium rather than 1*H*-1,2,4-triazol-4-ium cation, except of 5-amino-3-azido-1*H*-1,2,4-triazol-4-ium nitrate (Bichay *et al.*, 2006). It is remarkable that the bond C5—N5 (1.325 (3) Å) in the cation A is shorter than the bonds C5—N1 (1.335 (3) Å) and C5—N4 (1.358 (3) Å). The analysis of bond lengths indicates that molecules forming by cation A can be described in the best way by the resonance structure of 5-amino-2-phenyl-2,4-dihydro-3*H*-1,2,4-triazol-3-iminium bromide (Fig. 4). A similar distributions of bond lengths are observed in many other salts of *C*-amino-1,2,4-triazoles (for example, see: Reck *et al.*, 1982; Lynch *et al.*, 1998, 1999; Bichay *et al.*, 2006; Matulková *et al.*, 2007; Guerfel *et al.*, 2007). Therefore, it can be concluded that the C5—NH_2 group plays an important role in the redistribution of positive charge in the *C*-amino-1,2,4-triazolium cations. Molecules including cation B are properly described by the resonance structure of 3,5-diamino-1-phenyl-4*H*-1,2,4-triazol-1-ium bromide (Fig. 4).

In the crystal the identical and parallel cations of type A or B form stacks along the *b* axis of the monoclinic cell (Fig. 5). In the direction [$\bar{1}$01] the adjacent stacks of the different-type cations form pairs in which they are displaced from each other on 0.5 cell parameter *b*. One-type cations from the nearest stacks are related in the same direction by a glide plane n perpendicular to [0, 1, 0] with glide component [1/2, 0, 1/2]. In the direction *c* the cations are turned from each other by 180° and displaced on 0.5 of cell parameter, *i.e.* are space related by 2-fold screw axis with direction [0, 1, 0] at 1/4, *y*, 1/4 with screw component [0, 1/2, 0]. Along the *c* axis one can see parallel linear chains which "links" consist of pairs of cations A and B connected with bromide anions Br1 and Br2 by means of the hydrogen bonds N3—H3B···Br1, N5'—H5'B···Br1, N4—H4···Br2, N4'—H4'···Br2, N5—H5B···Br2, N3'—H3'B···Br2 (Table 1). The nearest chains in the plane perpendicular to *b* axis are connected with each other by continuous net of hydrogen bonds N3—H3A···N2^{i} and N3'—H3'A···N2^{ii}, forming parallel molecular layers with identity period equal to the unit-cell parameter *b* (Fig. 6). The layers are connected with one another by hydrogen bonds N5—H5A···Br1^{iii} and N5'—H5'A···Br1^{iv}. In the parallel layers one-type cations are turned from each other by 180°, *i.e.* they are space related by inversion centre with coordinates [0, 0, 0]. Thereby, the $C_8H_{10}N_5^+$ cations and bromide anions form a three-dimensional framework in the crystal.

In conclusion, the present study and previously reported theoretical (Anders *et al.*, 1997) and experimental (Chernyshev *et al.*, 2008) results indicate that the structures attributed to the products of quaternization of 1-substituted 3,5-diamino-1,2,4-triazoles (Steck *et al.*, 1958), apparently, are erroneous and need correction by means of modern analytical methods. Also it would be interesting to investigate the structure of salts of another 1-substituted 3-amino-1,2,4-triazoles with a view to evaluate the role of C3—NH_2 group in the delocalization of positive charge in 3-amino-1,2,4-triazolium cations.

Experimental

The crystals of 1-phenyl-1*H*-1,2,4-triazole-3,5-diamine hydrobromide suitable for X-ray analysis were obtained from a solution of 3-amino-5,7-dimethyl-2-phenyl-[1,2,4]triazolo[4,3-*a*]pyrimidin-2-ium bromide (TPB) in 1:9 water: acetonitrile mixture as a result of hydrolysis in the course of slow evaporation at room temperature during one week. The TPB was prepared by the following procedure.

A mixture of 1-phenyl-1*H*-1,2,4-triazole-3,5-diamine hydrobromide (0.73 g, 2.85 mmol), 2,4-pentanedion (0.371 g, 3.71 mmol) and ethanol (5 ml) was refluxed for 15 min and then cooled to room temperature. The precipitate formed was filtered off and recrystallized from ethanol to give 0.757 g (83% yield) of TPB, mp 221–223 °C. ^{1}H NMR (300 MHz) δ: 1.95 (s, 3H, CH_3), 2.95 (s, 3H, CH_3), 7.22 (s, 1H, CH), 7.67–7.83 (m, 5H, Ph), 8.37 (s, 2H, NH_2). ^{13}C NMR (150 MHz) δ: 17.66,

24.37, 113.62, 130.13, 130.30, 132.16, 132.63, 147.86, 153.85, 159.74, 170.43. LCMS: 240.29 [$C_{13}H_{14}N_5^+$]. Anal. Calcd for $C_{13}H_{14}BrN_5$: C, 48.76; H, 4.41; N, 21.87. Found: C, 48.81; H, 4.21; N, 21.98.

Starting 1-phenyl-1*H*-1,2,4-triazole-3,5-diamine hydrobromide used for the preparation of TPB was obtained by addition of equimolar amount of 48% hydrobromic acid to an ethanol solution of 3,5-diamino-1-phenyl-1,2,4-triazole. The latter compound was synthesized by known method (Steck *et al.*, 1958).

Refinement

C-bound H atoms were positioned geometrically (C—H 0.93 Å), while the rest H atoms were located on difference map and further placed in idealized positions (N—H 0.86 Å). All H atoms were refined as riding on their parent atoms, with U_{iso}(H) = 1.2 U_{eq}(parent atom).

253 parameters	$\Delta\rho_{max}$ = 0.63 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.52 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.022; wR factor = 0.050; data-to-parameter ratio = 14.5.

In the title complex, $[Co(C_8H_7O_3)_2(C_6H_6N_2O)(H_2O)_2]$, the Co^{II} atom is coordinated by three O atoms from two 4-methoxybenzoate ligands, which act in different modes, *viz.* monodentate and bidentate, two water molecules and one N atom of the isonicotinamide ligand in a distorted octahedral geometry. The monodentate-coordinated carboxylate group is involved in an intramolecular O—H···O hydrogen bond with the coordinated water molecule. In the crystal structure, intermolecular O—H···O and N—H···O hydrogen bonds link the molecules into layers parallel to the *ab* plane. The crystal packing is further stabilized by weak C—H···O hydrogen bonds and π–π interactions indicated by the short distance of 3.6181 (8) Å between the centroids of the benzene and pyridine rings of neighbouring molecules.

Diaqua(isonicotinamide-κN^1)(4-methoxybenzoato-$\kappa^2 O,O'$)(4-methoxybenzoato-κO)cobalt(II)

T. Hökelek, Y. Süzen, B. Tercan, E. Tenlik and H. Necefoglu

Comment

As a part of our ongoing investigation on transition metal complexes of nicotinamide (NA), one form of niacin (Krishnamachari, 1974), and/or the nicotinic acid derivative *N*,*N*-diethylnicotinamide (DENA), an important respiratory stimulant (Bigoli *et al.*, 1972), the title compound has been synthesized. Herein we report its crystal structure.

The title compound, (I), is a monomeric complex, where the Co^{II} ion is surrounded by two methoxybenzoate (MB) anions, one isonicotinamide (INA) ligand and two coordinated water molecules. One of the MB anions acts as a bidentate ligand, while the other is monodentate. The structures of similar complexes , $[Mn(C_9H_{10}NO_2)_2(C_6H_6N_2O)(H_2O)_2]$ (II) (Hökelek *et al.*, 2009*a*), $[Co(C_9H_{10}NO_2)_2(C_6H_6N_2O)(H_2O)_2]$ (III) (Hökelek *et al.*, 2009*b*), $[Cd(C_8H_7O_2)_2(C_6H_6N_2O)_2(H_2O)].H_2O$ (IV) (Necefoğlu *et al.*, 2010), $[Zn(C_9H_{10}NO_2)_2(C_6H_6N_2O)(H_2O)_2]$ (V) (Hökelek *et al.*, 2009*c*) and $[Zn(C_8H_8NO_2)_2(C_6H_6N_2O)_2].H_2O$ (VI) (Hökelek *et al.*, 2009d) have also been determined.

In (I) (Fig. 1), the four O atoms (O1, O2, O5 and O9) in the equatorial plane around the Co1 form a highly distorted square-planar arrangement, while the distorted octahedral coordination geometry is completed by the N atom (N1) of INA ligand and the O atom (O8) of the second water molecule in the axial positions. The average Co—O bond length is 2.1171 (12) Å and the Co atom is displaced out of the least-squares planes of the carboxylate groups (O1/C1/O2) and (O4/C9/O5) by -0.0061 (2) Å and -0.5367 (2) Å, respectively. The dihedral angle between the planar carboxylate groups and the adjacent benzene rings A (C2—C7) and B (C9—C14) are 12.12 (12)° and 9.26 (13)°, respectively, while those between rings A, B and C (N1/C17—C21) are A/B = 78.18 (4), A/C = 74.20 (5) and B/C = 6.23 (5) °. The intramolecular O—H···O hydrogen bond (Table 1) between the monodentate-coordinated carboxyl group and a coordinated water molecule results in a six-membered ring D (Co1/O4/O5/O8/C9/H81) adopting envelope conformation, with atom Co1 displaced by -0.5481 (2) Å from the plane of the other ring atoms. In (I), the O1—Co1—O2 angle is 60.32 (4)°. The corresponding O—M—O (where *M* is a metal) angles are 54.71 (4)° in (IV), 60.03 (6)° in (V), 59.02 (8)° in (VI) and 55.2 (1)° in $[Cu(Asp)_2(py)_2]$ (where Asp is acetylsalicylate and py is pyridine) [(VII); Greenaway *et al.*, 1984].

In the crystal structure, intermolecular O—H···O and N—H···O hydrogen bonds (Table 1) link the molecules into layers parallel to *ab* plane. The crystal packing is further stabilized by the weak C—H···O hydrogen bonds (Table 1). The π–π contact between the benzene and pyridine rings, *Cg*2—*Cg*3^{i} [symmetry code: (i) *x*, *y* + 1, *z*, where *Cg*2 and *Cg*3 are the centroids of the rings B (C9—C14) and C (N1/C17—C21), respectively] may also stabilize the structure, with centroid-centroid distance of 3.6181 (8) Å.

Experimental

The title compound was prepared by the reaction of $CoSO_4.7H_2O$ (2.81 g, 10 mmol) in H_2O (50 ml) and INA (2.44 g, 20 mmol) in H_2O (50 ml) with sodium 4-methoxybenzoate (3.48 g, 20 mmol) in H_2O (100 ml). The mixture was filtered and set aside to crystallize at ambient temperature for one week, giving brown single crystals.

Refinement

Atoms H81, H82, H91, H92 (for water molecules) and H2A, H2B (for NH_2) were located in difference Fourier maps and refined isotropically. The remaining H atoms were positioned geometrically with C—H = 0.93 and 0.96 Å for aromatic and methyl H atoms, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = 1.2-1.5U_{eq}(C).

Figures

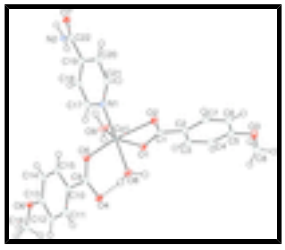

Fig. 1. The molecular structure of (I) with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. Dashed line indicates the hydrogen-bonding.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.022$	$w = 1/[\sigma^2(F_o^2) + (0.0215P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.050$	$(\Delta/\sigma)_{max} = 0.003$
$S = 1.01$	$\Delta\rho_{max} = 0.29$ e Å^{-3}
4838 reflections	$\Delta\rho_{min} = -0.24$ e Å^{-3}
333 parameters	Absolute structure: Flack (1983), 1761 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.015 (7)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 3 June 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 110 K; mean σ(C–C) = 0.006 Å; R factor = 0.034; wR factor = 0.091; data-to-parameter ratio = 9.5.

In the title compound, $C_{16}H_{13}BrO_2$, two benzene rings form a dihedral angle of 44.3 (9)°. In the crystal, weak intermolecular C—H···O hydrogen bonds link the molecules into chains propagating in [010]. The crystal packing also exhibits short Br···Br contacts of 3.4787 (8) Å. A comparison of the DFT-optimized gas-phase molecular geometry with that in the crystal structure revealed only small differences.

(2*E*)-1-(2-Bromophenyl)-3-(4-methoxyphenyl)prop-2-en-1-one

J. P. Jasinski, R. J. Butcher, K. Veena, B. Narayana and H. S. Yathirajan

Comment

Chalcones, or 1,3-diaryl-2-propen-1-ones, belong to the flavonoid family. Chemically they consist of open-chain flavonoids in which the two aromatic rings are joined by a three-carbon α,β-unsaturated carbonyl system. A vast number of naturally occurring chalcones are polyhydroxylated in the aryl rings. The radical quenching properties of the phenolic groups present in many chalcones have raised interest in using the compounds or chalcone rich plant extracts as drugs or food preservatives (Dhar, 1981). The crystal structures of some closely related chalcones, *viz*., 1-(4-bromophenyl)-3-(3-methoxy-phenyl)prop-2-en-1-one (Patil *et al.*, 2007); 4-bromo-4'-methoxy-chalcone (Li *et al.*, 1992), 4-bromo-4'-methoxychalcone (Arai *et al.*, 1994) and 1-(4-bromophenyl)-3-(4-methoxyphenyl)prop-2-en-1-one (Shettigar *et al.*, 2006) have been reported. Hence in continuation with the synthesis and crystal structure determination and also owing to the importance of these flavonoid analogs, this new bromo chalcone, (I), $C_{16}H_{13}BrO_2$, is synthesized and its crystal structure is reported.

The title compound, (I), $C_{16}H_{13}BrO_2$, is a chalcone with 4-methoxyphenyl and 2-bromophenyl rings bonded at opposite rings of a propene group (Fig. 1). The dihedral angle between mean planes of the *para*-methoxy and *ortho*-bromo substituted benzene rings is 44.3 (9)°. The angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 4-meyhoxyphenyl and 2-bromophenyl rings are 6.3 (1)° and 44.6(36°, respectively. Bond distances and angles are in normal ranges (Allen *et al.*, 1987). While no classical hydrogen bonds are present, a weak intermolecular C12—H12A···O1 interaction (Table 1) is observed which contributes to the stability of crystal packing.

A density functional theory (DFT) geometry optimization molecular orbital calculation (Schmidt & Polik, 2007) was performed on (I) with the B3LYP 6–31-G(*d*) basis set (Hehre *et al.*, 1986). The dihedral angle between mean planes of the *para*-methoxy and *ortho*-bromo substituted benzene rings becomes 45.98°, an increase of 1.59°. The angles between the mean plane of the prop-2-ene-1-one group and the mean planes of the 4-meyhoxyphenyl and 2-bromophenyl rings become 3.65° and 42.40°, changes of -2.65° and +0.74°, respectively. These observations suggest that the weak intermolecular C12—H12A···O1 interaction produces a small effect on crystal stability.

Experimental

A 50% KOH solution was added to a mixture of 2-bromo acetophenone (0.01 mol, 1.99 g) and 4-methoxy benzaldehyde (0.01 mol, 1.36 g) in 25 ml of ethanol (Fig. 2). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. The single-crystal was grown from ethyl acetate by slow evaporation method and yield of the compound was 50% (m.p.336–338 K). Analytical data, composition (%): found (calculated): C: 60.52 (60.59%); H: 4.10 (4.13%).

Refinement

The H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C–H distances = 0.95–0.98Å and with U_{iso}(H) = 1.17–1.47 U_{eq}(C).

Figures

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.034$	H-atom parameters constrained
$wR(F^2) = 0.091$	$w = 1/[\sigma^2(F_o^2) + (0.0718P)^2 + 0.5775P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.07$	$(\Delta/\sigma)_{max} = 0.001$
1641 reflections	$\Delta\rho_{max} = 0.71$ e Å^{-3}
173 parameters	$\Delta\rho_{min} = -0.65$ e Å^{-3}
1 restraint	Absolute structure: Flack (1983), 133 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.00 (3)

Special details

Experimental. IR data (KBr) ν cm^{-1}: 2998 cm^{-1}, 2937 cm^{-1}, 2839 cm^{-1} (C—H al.str), 3058 cm^{-1} (C—H ar. str) 1646 cm^{-1} (C=O), 1580 cm^{-1} (C=C); 1245 cm^{-1} (C—O—C).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.026; wR factor = 0.072; data-to-parameter ratio = 17.1.

The asymmetric unit of the centrosymmetric dinuclear title compound, $[Cu_2(C_8H_7O_3)_4(C_6H_6N_2O)_2(H_2O)_2]$, contains one half of the complex molecule. Each Cu^{II} atom is five-coordinated by one N atom from one bridging nicotinamide ligand and one O atom from another symmetry-related bridging nicotinamide ligand, two O atoms from two 4-methoxybenzoate ligands, and one water molecule, forming a distorted square-pyramidal geometry. Intermolecular O—H···O and N—H···O hydrogen bonds link the molecules into layers parallel to $(\bar{1}01)$. π–π interactions, indicated by short intermolecular distances of 3.801 (1) Å between the centroids of the benzene rings and 3.653 (1) Å between the centroids of the pyridine rings, further stabilize the structure.

Comment

As a part of our ongoing study of transition metal complexes of nicotinamide (Hökelek & Necefoğlu, 1996; Hökelek *et al.*, 2009*a, b, c, d*), herein we report the crystal structure of the title dinuclear complex.

The title compound, (I), consists of dimeric units located around a crystallographic symmetry centre and made up of two Cu cations, four 4-methoxybenzoate (MB) anions, two nicotinamide (NA) ligands and two water molecules (Fig. 1). Both of the Cu^{II} centres are five-coordinated with distorted square-pyramidal environments, and the two monomeric units are bridged through the two nicotinamide (NA) ligands about an inversion center. The Cu1···Cu1^{i} (symmetry code: (i) 2 - *x*, -*y*, 1 - *z*) distance is 7.1368 (3) Å. The average Cu—O bond length is 2.0626 (10) Å, and the Cu atom is displaced out of the least-squares planes of the carboxylate groups (O1/C1/O2) and (O4/C9/O5) by 0.0015 (2) and -0.2589 (2) Å, respectively.

The dihedral angles between the planar carboxylate groups and the adjacent benzene rings A (C2—C7) and B (C10—C15) are 1.85 (5) and 10.16 (7) °, respectively, while those between rings A, B and C (N1/C17—C21) are A/B = 28.50 (4), A/C = 81.64 (4), B/C = 58.50 (4) °.

In the crystal structure, intermolecular O—H···O and N—H···O hydrogen bonds (Table 1) link the molecules into layers. The π–π contacts between the benzene rings and between the pyridine rings, *Cg*2—*Cg*2^{i} and *Cg*3—*Cg*3^{ii} [symmetry codes: (i) 2 - *x*, 2 - *y*, -*z*; (ii) 1 - *x*, 2 - *y*, -*z*, where *Cg*2 and *Cg*3 are the centroids of the rings B (C10—C15) and C (N1/C17—C21)] may further stabilize the structure, with centroid-centroid distances of 3.801 (1) and 3.653 (1) Å, respectively.

Experimental

The title compound was prepared by the reaction of $CuSO_4.5H_2O$ (2.50 g, 10 mmol) in H_2O (50 ml) and NA (2.44 g, 20 mmol) in H_2O (50 ml) with sodium 4-methoxybenzoate (3.48 g, 20 mmol) in H_2O (100 ml). The mixture was filtered and set aside to crystallize at ambient temperature for one week, giving blue single crystals.

Refinement

Atoms H81, H82 (for H_2O) and H2A, H2B (for NH_2) were located in difference Fourier maps and refined isotropically. The remaining H atoms were positioned geometrically with C—H = 0.93 and 0.96 Å for aromatic and methyl H atoms, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = xU_{eq}(C), where x = 1.5 for methyl H and x = 1.2 for aromatic H atoms.

Figures

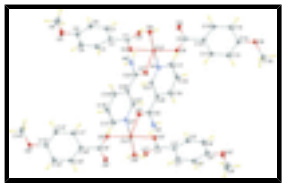

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level [symmetry code: (') 2 - *x*, -*y*, 1 - *z*].

Data collection

Bruker Kappa APEXII CCD area-detector diffractometer	5403 independent reflections
Radiation source: fine-focus sealed tube	4813 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.021$
φ and ω scans	$\theta_{max} = 28.5°$, $\theta_{min} = 1.7°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$h = -18\rightarrow18$
$T_{min} = 0.678$, $T_{max} = 0.781$	$k = -10\rightarrow11$
20329 measured reflections	$l = -24\rightarrow24$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.026$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.072$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0384P)^2 + 1.1134P]$ where $P = (F_o^2 + 2F_c^2)/3$
5403 reflections	$(\Delta/\sigma)_{max} = 0.001$

316 parameters

0 restraints

$\Delta\rho_{max} = 0.47$ e Å^{-3}

$\Delta\rho_{min} = -0.29$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Bis(μ-4-phenylpyridine *N*-oxide-κ^2O:*O*)-bis[bis(1,1,1,5,5,5-hexafluoropentane-2,4-dionato)copper(II)]

Ana I. Ramos, José A. Fernandes, Patrícia Silva, Paulo J. A. Ribeiro-Claro, Susana S. Braga and Filipe A. Almeida Paz*

Department of Chemistry, CICECO, University of Aveiro, 3810-193 Aveiro, Portugal
Correspondence e-mail: filipe.paz@ua.pt

Received 9 June 2010; accepted 12 June 2010

Key indicators: single-crystal X-ray study; T = 150 K; mean σ(C–C) = 0.004 Å; disorder in main residue; R factor = 0.048; wR factor = 0.139; data-to-parameter ratio = 16.2.

The asymmetric unit of the title compound, $[Cu_2(C_5HF_6O_2)_4(C_{11}H_9NO)_2]$, contains one half of the centrosymmetric dinuclear complex. The coordination geometry of the Cu^{II} atom is octahedral, exhibiting a typical Jahn–Teller distortion. One trifluoromethyl group is rotationally disordered between two orientations in a 1:1 ratio.

Bis(μ-4-phenylpyridine *N*-oxide-κ^2O:*O*)bis[bis(1,1,1,5,5,5-hexafluoropentane-2,4-dionato)copper(II)]

A. I. Ramos, J. A. Fernandes, P. Silva, P. J. A. Ribeiro-Claro, S. S. Braga and F. A. Almeida Paz

Comment

The coordination chemistry of 4-phenylpyridine-*N*-oxide (PPNO; $C_{11}H_9NO$) is rather unknown. Surveying the Cambridge Structural Database (Allen, 2002) only two coordination compounds were found, namely a copper (Watson & Johnson, 1971) and a tin compound (Papadaki *et al.*, 1999).

The title compound, $[Cu(C_5HF_6O_2)_2(C_{11}H_9NO)_2]$ (**I**) (where $C_5HF_6O_2^-$ is hexafluoroacetylacetonate and $C_{11}H_9NO$ corresponds to 4-phenylpyridine-*N*-oxide), has a bright green colour which is of interest for the potential use as a dye in several applications, such as in organic electronics. Coloured materials, including metal coordination compounds, have been explored in the last decades because pigmentation is a strong indicative of promising physical and optical properties (Vogler & Kunkely, 2001). Recent applications of copper coordination complexes include a Schottky diode based on a macrocyclic binuclear Cu^{2+} complex (Akkılıç *et al.*, 2010) and a series of Graetzel solar cells using 6,6'-dimethyl-dicarboxylated-bipyridine complexes (Bessho *et al.*, 2008). The use of Cu^{2+} complexes in OLEDs is still limited (Armaroli *et al.*, 2007), and emission still relies mostly on Cu^+ complexes, such as [Cu(I)*bis*(triphenylphosphine)dipyridophenazine] (Walsh *et al.*, 2009) and three Cu(I)pyridylbenzimidazole complexes (Si *et al.*, 2008). In addition, copper complexes are advantageous from the technological processing perspective, adaptable to various film deposition techniques: molecular beam epitaxy (Kambayashi *et al.*, 2005), vacuum evaporation (Peranantham *et al.*, 2007), electrodeposition (Chan *et al.*, 2010) and chemical vapour deposition (CVD), either plasma-enhanced (Daniel *et al.*, 2009) or the widespread metal organic CVD (Jeon *et al.*, 2008).

Following our interest in the preparation and study of the properties of copper compounds (Fernandes *et al.*, 2010; Shi *et al.*, 2006; Paz *et al.*, 2005; Girginova *et al.*, 2005; Brandão *et al.*, 2005) we have reacted $[Cu(hfac)_2]$ (where $hfac^-$ stands for hexafluoroacetylacetonate) with PPNO, affording the title compound as a vivid green crystalline material, whose crystal structure we report herein.

The structure is dimeric having a point of inversion in the geometrical centre of the quadrangle defined by $Cu1\cdots O5\cdots Cu1^{(i)}\cdots O5^{(i)}$ (Figure 1) [symmetry code: (i) 2 - *x*, -*y*, -*z*]. The asymmetric unit contains one PPNO ligand and one $[Cu(hfac)_2]$ moiety. The atoms Cu1, O2, O4 and O5, and their symmetry-related counterparts [symmetry code (i)], form a plane (longest distance to the average plane of about 0.041 Å). Likewise, atoms Cu1, O1 and O3, and their symmetry-related counterparts [symmetry code (i)], define a second plane (longest distance to this average plane of about 0.048 Å), which is perpendicular to the previous one. The Cu^{2+} centre exhibits a typical octahedral coordination environment with a strong Jahn-Teller distortion: the Cu—O bonds (equatorial plane) range from 1.9500 (19) to 1.9751 (18) Å, while the Cu—O bonds (at apical positions) are either 2.251 (2) or 2.4427 (18) Å. With the exception of the angles O5—Cu1—$O5^{(i)}$ [76.90 (7)°] and O2—Cu1—O4 [101.08 (8)°], the *cis* octahedral angles fall within a rather short range around the ideal value: 84.55 (7)–97.37 (8)° (Table 1). The *trans* octahedral angles are between 161.06 (8)° and 174.96 (8)°. The two average

planes containing the aromatic rings of PPNO are mutually rotated by *ca* 37°. The structure exhibits crystallographic disorder associated with the fluorine atoms F4, F5 and F6 (rates of occupancy 50% for each location). Noteworthy, symmetry-related copper complexes are located at the vertex of the unit cell (Figure 2), with the inner space being essentially occupied by the coordinated organic ligands, leading to a hydrophobic empty space of about 36 $Å^3$.

Experimental

Chemicals were purchased from commercial sources and were used as received without purification.

4-Phenylpyridine-*N*-oxide (PPNO, 71.7 mg, 0.419 mmol, Aldrich) was slowly added to a previously-prepared $[Cu(hfac)_2]$ (100.0 mg, 0.209 mmol; $hfac^-$ stands for hexafluoroacetylacetonate) solution in 10 ml of acetone. The resulting solution was magnetically stirred at 30 °C for 30 minutes. By slow evaporation to dryness, a green solid was obtained, which was dissolved in ethanol, gravity filtered and deposited above a water layer. Green crystals of the title compound formed after two days.

Refinement

Hydrogen atoms bound to carbon were located at their idealized positions and were included in the final structural model in riding-motion approximation with C—H = 0.95 Å. The isotropic displacement parameters for these atoms were fixed at 1.2 times U_{eq} of the respective carbon atom.

The substituent —CF_3 groups were found to be severely affected by thermal disorder. Attempts to model this disorder were only successful for one moiety which was included in the final structure with two crystallographic positions (fixed rate of occupancy of 50% for each). In order to ensure a chemically reasonable geometry for this disorder moiety all C—F and F···F distances in the structure were restrained to common refineable values.

Figures

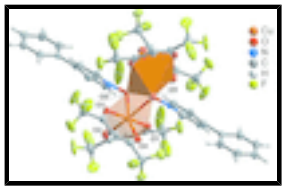

Fig. 1. Schematic representation, in ball-and-stick and polyhedral fashions, of the molecular structure of the title compound. The crystallographic disorder associated with the —CF_3 group was omitted for simplicity. Symmetry code: (i) 2 - *x*, -*y*, -*z*.

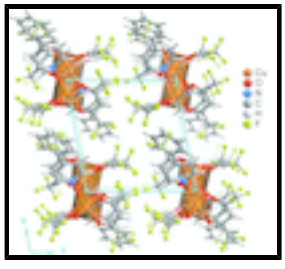

Fig. 2. Perspective view along the *c* axis of the unit cell of the crystal packing of the title compound.

Bis(μ-4-phenylpyridine *N*-oxide-κ^2*O*:*O*)bis[bis(1,1,1,5,5,5- hexafluoropentane-2,4-dionato)copper(II)]

Crystal data

$[Cu_2(C_5HF_6O_2)_4(C_{11}H_9NO)_2]$	$Z = 1$
$M_r = 1297.70$	$F(000) = 642$
Triclinic, $P\overline{1}$	$D_x = 1.780$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 10.3830$ (4) Å	Cell parameters from 9842 reflections
$b = 10.7870$ (4) Å	$\theta = 2.9$–$28.6°$
$c = 11.2498$ (4) Å	$\mu = 1.03$ mm^{-1}
$\alpha = 99.055$ (2)°	$T = 150$ K
$\beta = 99.036$ (2)°	Block, green
$\gamma = 98.258$ (2)°	0.18 × 0.10 × 0.09 mm
$V = 1210.40$ (8) Å^3	

Data collection

Bruker X8 Kappa CCD APEXII diffractometer	6427 independent reflections
Radiation source: fine-focus sealed tube	5461 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.029$
ω/phi scans	$\theta_{max} = 29.1°$, $\theta_{min} = 3.7°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1997)	$h = -14 \rightarrow 14$
$T_{min} = 0.836$, $T_{max} = 0.913$	$k = -14 \rightarrow 14$
47759 measured reflections	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.048$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.139$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0712P)^2 + 2.0571P]$ where $P = (F_o^2 + 2F_c^2)/3$
6427 reflections	$(\Delta/\sigma)_{max} = 0.003$
397 parameters	$\Delta\rho_{max} = 1.21$ e Å^{-3}
24 restraints	$\Delta\rho_{min} = -1.40$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 15 June 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.037; wR factor = 0.103; data-to-parameter ratio = 17.4.

The imino–carbon double-bond in the title Schiff base, $C_{20}H_{21}N_3O_3$, has an E configuration; the six-membered aromatic substituent (r.m.s. deviation = 0.012 Å) is nearly coplanar with five-membered pyrazole substituent (r.m.s. deviation = 0.031 Å), the dihedral angle between the two systems being 11.4 (1)°]. The phenyl ring connected to the pyrazole ring is aligned at 45.5 (1)° with respect to this five-membered ring. The N atoms in the ring show pyramidal coordinations.

4-[(3,4-Dimethoxybenzylidene)amino]-1,5-dimethyl-2-phenyl-1*H*-pyrazol-3(2*H*)-one

A. M. Asiri, S. A. Khan, K. W. Tan and S. W. Ng

Comment

4-Aminoantipyrine (4-amino-1,2-dihydro-1,5-dimethyl-2-phenyl-3*H*-pyrazol-3-one) possesses an aminopyrazolone unit, a feature that allows the compound to condense with aromatic aldehydes to yield Schiff bases. The Schiff base derived from the benzaldehyde homolog has nearly coplanar phenyl and pyrazoly rings (Montalvo-González & Ariza-Castolo, 2003). In the title benzaldehyde analog (Scheme I, Fig. 1), the 6-membered ring is nearly coplanar with 5-membered pyrazolyl ring [dihedral angle between the two systems 11.4 (1) °]. The phenyl ring connected to the pyrazolyl ring is aligned at 45.5 (1)°.

Experimental

3,4-Dimethoxybenzaldehyde (0.36 g, 2.2 mmol) and 4-aminoantipyrine (0.45 g, 2.2 mmol) here heated in methanol (15 ml) for 5 h to afford a colorless precipitate. The solid material was collected and recrystallized from methanol.

Refinement

Carbon-bound H-atoms were placed in calculated positions [C–H 0.95 to 0.98 Å, U(H) 1.2 to 1.5U_{eq}(C)] and were included in the refinement in the riding model approximation.

Figures

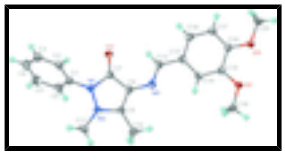

Fig. 1. Displacement ellipsoid plot (Barbour, 2001) of $C_{20}H_{21}N_3O_3$ at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius.

Received 15 June 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.051; wR factor = 0.157; data-to-parameter ratio = 20.1.

In the title molecule, $C_{15}H_{17}NO_3S$, the C—S—N—$C_{benzene}$ torsion angle is 81.45 (16)°, and the two aromatic rings form a dihedral angle of 45.83 (12)°. In the crystal structure, weak intermolecular C—H···O hydrogen bonds link the molecules into chains parallel to the b axis.

N-Ethyl-*N*-(2-methoxyphenyl)benzenesulfonamide

Aziz-ur-Rehman, H. Rafique, M. Akkurt, N. Dilber, M. A. Abbasi and I. U. Khan

Comment

Sulfonamides are known as biologically active compounds (Ozbek *et al.*, 2007; Parari *et al.*, 2008). As a contribution to a structural study of sulfonamide derivatives (Mariam *et al.*, 2009; Arshad *et al.*, 2009; Asiri *et al.*, 2009; Khan *et al.*, 2010; Akkurt *et al.*, 2010*a*,b) we present here the title compound, (I).

The title molecule (Fig. 1) is bent at the S atoms with the C1—S1—N1—C9 torsion angle of 81.45 (16)°. The dihedral angle between the phenyl (C1–C6) and benzene (C9–C14) rings is 45.83 (12)°.

In the crystal structure of (I), weak intermolecular C—H···O hydrogen bonds (Table 1) link the molecules into chains parallel to *b* axis.

Experimental

A mixture of *N*-(2-methoxyphenyl)benzenesulfonamide (1.24 g, 5.0 mmol), sodium hydride (0.24 g, 10 mmol) and *N*,*N*-dimethylformamide (10 ml) was stirred at room temperature for 30 min and then ethyl iodide (0.4 ml, 5.0 mmol) was added. The stirring was continued further for a period of 3 h and the contents were poured over crushed ice. The precipitated product was isolated, washed and re-crystallized from methanolic solution. It was crystallized by slow evaporation of the solvent. Yield 72%.

Refinement

All H atoms bonded to C atoms were positioned geometrically and refined using a riding model, with C—H = 0.93Å (aromatic), 0.96 Å (methyl) and 0.97 Å (methylene) with U_{iso}(H) = 1.2U_{eq}(aromatic, methylene) and U_{iso}(H) = 1.5U_{eq}(methyl).

Figures

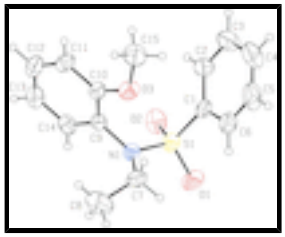

Fig. 1. Molecular structure of (I) showing the atom labelling scheme, Displacement ellipsoids are drawn at the 30% probability level.

Crystal data

$C_{15}H_{17}NO_3S$	$F(000) = 616$
$M_r = 291.37$	$D_x = 1.303$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 3431 reflections
$a = 9.3098$ (5) Å	$\theta = 2.3$–$24.5°$
$b = 9.5664$ (6) Å	$\mu = 0.22$ mm^{-1}
$c = 17.1949$ (10) Å	$T = 296$ K
$\beta = 104.040$ (2)°	Block, colourless
$V = 1485.65$ (15) Å^3	0.15 × 0.10 × 0.06 mm
$Z = 4$	

Data collection

Bruker APEXII CCD diffractometer	1963 reflections with $I > 2\sigma(I)$
Radiation source: sealed tube	$R_{int} = 0.045$
graphite	$\theta_{max} = 28.3°$, $\theta_{min} = 3.1°$
φ and ω scans	$h = -12\rightarrow10$
13197 measured reflections	$k = -11\rightarrow12$
3670 independent reflections	$l = -20\rightarrow22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.157$	H-atom parameters constrained
$S = 0.99$	$w = 1/[\sigma^2(F_o^2) + (0.0842P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3670 reflections	$(\Delta/\sigma)_{max} < 0.001$
183 parameters	$\Delta\rho_{max} = 0.30$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.27$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The

observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.010 Å; R factor = 0.037; wR factor = 0.078; data-to-parameter ratio = 14.5.

The title compound, $C_{14}H_{12}INO$, adopts the phenol–imine tautomeric form. The dihedral angle between the aromatic rings is 20.6 (3)°. The molecular conformation is stabilized by an intramolecular O—H···N hydrogen bond while in the crystal, weak intermolecular C—H···O hydrogen bonds link the molecules into a zigzag chain parallel to the *b* axis.

Comment

Schiff bases are used as starting materials in the synthesis of important drugs, such as antibiotics and antiallergic, antiphlogistic, and antitumor substances (Barton *et al.*, 1979; Layer, 1963; Ingold 1969). On the industrial scale, they have a wide range of applications, such as dyes and pigments (Taggi *et al.*, 2002). There are two characteristic properties of Schiff bases, viz. Photochromism and thermochromism (Cohen *et al.*, 1964). In general, Schiff bases display two possible tautomeric forms, the phenol-imine (OH) and the keto-amine (NH) forms. Depending on the tautomers, two types of intramolecular hydrogen bonds are observed in Schiff bases: O—H···N in phenol-imine (Şahin *et al.*, 2009) and N—H···O in keto-amine tautomers (Tanak *et al.*, 2009). Another form of the Schiff base compounds is also known as zwitterion having an ionic intramolecular hydrogen bond (N^+—H···O^-) and this form is rarely seen in the solid state (Özdemir *et al.*, 2010).

The molecular structure of the title compound, $C_{14}H_{17}O_1N_1I_1$, shows that the molecule exists in the phenol-imine form (Fig. 1). The C1=N1 [1.269 (8) Å] and C9=N1 [1.397 (7) Å] bond distances are of double-bond character, whereas, C7—O1 [1.332 (8) Å] distance is single bond. These distances are similar to that reported in the literature [1.277 (3) Å] and [1.402 (3) Å] for C=N and [1.347 (3) Å] for C—O respectively (Şahin *et al.*, 2009).

The molecule of title compound is non-planar (Fig. 1), the two phenyl rings are twisted by a dihedral angle of 20.6 (3)°. This conformation is stabilized by intramolecular N-H···O hydrogen bond (Table 1, Fig. 1) forming S(6) ring (Bernstein *et al.*, 1995). weak intermolecular C-H···O hydrogen bonds link the molecules forming a zig-zag chain parallel to the b axis (Table 1, Fig. 2). The I atom is slightly out of the C9-C14 ring by 0.18 (1)Å.

Experimental

The compound (*E*)-2-[(4-Iodophenylimino)methyl]-6-methylphenol was prepared by reflux a mixture of a solution containing 3-methylsalicylaldehyde (0.1 ml 0.82 mmol) in 20 ml e thanol and solution containing 4-Iodoaniline (0.179 g 0.82 mmol) in 20 ml e thanol.The reaction mixture was stirred for 1 hunder reflux. The crystals of (*E*)-2-[(4-Iodophenylimino)methyl]-6-methylphenol suitable for x-ray analysis were obtained from ethylalcohol by slow evaporation (yield 51%; m.p.350-353 K).

Refinement

The position of the H1 atom was obtained from a difference map of the electron density in the unit-cell and was refined freely. Other H atoms were positioned geometrically and treated using a riding model, fixing the bond lengths at 0.93 Å for aromatic CH and at 0.96 Å for CH_3. The displacement parameters of the H atoms were constrained as $U_{iso}(H)= 1.2U_{eq}$($1.5U_{eq}$ for methyl) of the parent atom.

Figures

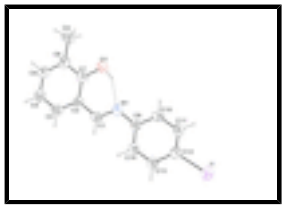

Fig. 1. The molecular structure of the title compound, showing the atom-numbering scheme and 30% probability displacement ellipsoids. H atoms are represented as small spheres of arbitrary radii. H bond is shown as dashed lines.

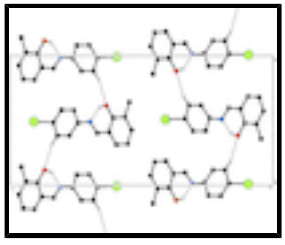

Fig. 2. Partial packing view showing the formation of zig-zag chain parallel to the b axis. H atoms not involved in hydrogen bondings have been omitted for clarity. C-H···O hydrogen bonds are represented as dashed lines

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.078$	$w = 1/[\sigma^2(F_o^2) + (0.0321P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.86$	$(\Delta/\sigma)_{max} = 0.001$
2267 reflections	$\Delta\rho_{max} = 0.65$ e Å^{-3}
156 parameters	$\Delta\rho_{min} = -0.29$ e Å^{-3}
0 restraints	Absolute structure: Flack (1983), 901 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.10 (5)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 12 May 2010; accepted 1 June 2010

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.003 Å; disorder in main residue; R factor = 0.043; wR factor = 0.111; data-to-parameter ratio = 14.6.

The molecule of the title compound, $C_{13}H_{14}ClNO_2$, is roughly planar [maximum deviation = 0.060 (2) Å] with the disordered Cl/CH_3 group asymetrically distributed on both sides of the mean plane. Indeed, the Cl and CH_3 located on the stereogenic carbon exchange each other with occupancy factors in the ratio 0.60:0.40. The whole crystal is a racemate. Non-classical C—H···O hydrogen bonds and π–π interactions [centroid–centroid distance = 3.6959 (9) Å] between symmetry-related phenyl rings stabilize the crystal structure.

Related literature

The title compound was synthesised as an intermediate in a search for a new synthetic route for silodosin, an adrenoceptor antagonist, see: Asselin *et al.* (2000); Bremner *et al.* (2000); Elworthy *et al.* (1997); Sorbera *et al.* (2001). For related structures, see: Moreno *et al.* (1998); Wang *et al.* (2007).

(*RS*)-1-(1-Acetylindolin-5-yl)-2-chloropropan-1-one

X.-M. Yang

Comment

In searching for new synthetic route of silodosin, a adrenoceptor antagonist (Sorbera *et al.* 2001; Elworthy *et al.* 1997; Asselin *et al.* 2000; Bremner *et al.* 2000), we synthesized the racemic intermediate,(*R*/*S*)-1-(1-acetylindolin-5-yl)-2-chloropropan-1-one.

The single-crystal structure analysis shows that the Cl and CH_3 located on the stereogenic carbon exchange each other with occupancy factor in the ration 60/40. Except for these disordered atoms, the molecule is roughly planar with the largest deviation from the mean plane (all heavy atoms except Cl and C13) being 0.060 (2)Å at C7 (Fig. 1). The two disordered atoms are dissymetrically distributed on both side of the mean plane. The geometry within the 1-acetylindoline fragment compares well with related structures as 1-acetylindoline (Moreno *et al.*, 1998) or 1-(trifluoro)acetylindoline (Wang *et al.*, 2007).

Non-classical C—H···O hydrogen bonds (Table 1, Fig. 2) link the molecules forming layers parallel to the (0 0 1) plane. These layers are further connected throught π-π interactions between symmetry related phenyl rings (Table 2).

Experimental

3.3 g aluminium trichloride was added to 20 ml dichloromethane, and stirred for 10 min. Then 2 g chloropropionyl-chloride was added, controling the temperature below 5¯C. A dichloromethane solution of 1-acetyl-indoline was added dropwise to the reaction solution, and stirred overnight to get 1.3 g crystalline solid (yield 72%). Crystals suitable for X-ray diffraction were obtained by slow evaporation of an ethyl acetate solution. Spectroscopic analysis: ^{1}H NMR (CD-Cl_3,δ, p.p.m.): 1.723–1.760(d, 3H), 2.259–2.269(s, 3H), 3.232–3.289(t, 2H), 4.109–4.166(t, 2H), 5.197–5.263(m, 1H), 7.864(s,1*H*), 7.864–7.895(d, 1H), 8.245–8.273(d, 1H).

Refinement

All H atoms attached to C atoms and N atom were fixed geometrically and treated as riding with C—H = 0.98 Å (methyl), 0.99 Å (methylene) and 1.0 Å (methine) with U_{iso}(H) = 1.2U_{eq}(Cmethine, Cmethylene) or U_{iso}(H) = 1.5U_{eq}(Cmethyl).

The Cl and CH3 substituents on the stereogenic carbon are exchanging each other and such disorder induces two configurations. Two sets of positions were defined for the atoms of this group and the site occupation factor of each conformation were refined while restraining their sum to unity and using restraints on C—C and C—Cl distances with the help of SAME and PART instructions within *SHELXL97* (Sheldrick, 2008). In the last stage of refinement, the disordered Cl and C atoms were anisotropically refined but the anistropic thermal parameters of the C atoms were restrained to have similar atomic displacement parameters within a tolerance s.u. of 0.01 Å^2.

Figures

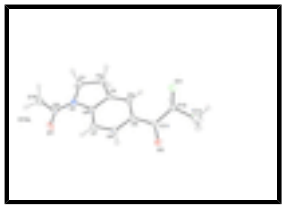

Fig. 1. The asymmetric unit of (I) with the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii. For clarity, only the major component of the disorder is represented.

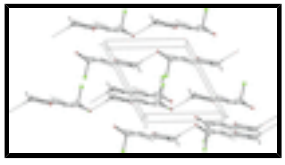

Fig. 2. Packing view showing the layers formed by C—H···O interaction. Hydrogen bonds are shown as dashed lines. H atoms not involved in hydrogen bondings have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.18$	$w = 1/[\sigma^2(F_o^2) + (0.0322P)^2 + 0.3925P]$ where $P = (F_o^2 + 2F_c^2)/3$
2594 reflections	$(\Delta/\sigma)_{max} = 0.001$
178 parameters	$\Delta\rho_{max} = 0.27$ e Å^{-3}
3 restraints	$\Delta\rho_{min} = -0.20$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 14 May 2010; accepted 23 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.020; wR factor = 0.056; data-to-parameter ratio = 12.7.

The asymmetric unit of the title Cd^{II} compound, $[Cd(N_3)_2(C_{12}H_8N_2)]_n$, contains a Cd^{II} atom, located on a twofold axis passing through the middle of the phenanthroline molecule, one azide ion and half of a 1,10-phenanthroline molecule. The Cd^{II} atom exhibits a distorted octahedral coordination including one chelating 1,10-phenanthroline ligand and four azide ligands. The crystal structure features chains along the c direction in which azide groups doubly bridge two adjacent Cd^{II} atoms in an end-on (EO) mode. Interchain π–π stacking interactions, with centroid–centroid separations of 3.408 (2) Å between the central aromatic rings of 1,10-phenanthroline molecules, lead to a supramolecular sheet parallel to the bc plane.

Comment

Many compounds with uncommon magnetic properties have been widely investigated by using azido ligand, resulting from its rich coordination fashions (Ribas *et al.*, 1999; Gao *et al.*, 2004). The azido ligand exhibits a variety of bridging modes such as bi-dentate end-on (EO) and end-to-end (EE) bridging fashions (Liu *et al.*, 2007; Cano *et al.*, 2005; Goher *et al.*, 2008; Mautner *et al.*, 2010). A number of compounds with various structures have been obtained by introducing auxiliary ligands to the metal-azido system (Abu-Youssef *et al.*, 2000; Bose *et al.*, 2004; Meyer *et al.*, 2005). The present example shows an infinite wavelike chain compound with 1,10-phenanthroline as an auxiliary ligand, $[Cd(N_3)_2(C_{12}H_8N_2)]$, in which azido ligand adopts the EO mode.

The asymmetric unit of the title compound contains half a Cd^{II} ion, one azido ion and half a 1,10-phenanthroline molecule (Fig. 1). The Cd^{II} ion exhibits a distorted octahedral geometry, coordinated by one chelating 1,10-phenanthroline ligand and four azido ligands with the end-on (EO) mode. The distances of Cd—N vary from 2.306 (2) to 2.411 (3) Å . The azido ligands doubly bridge neighbouring Cd^{II} centers in the EO fashion, yielding an infinite wave-like Cd^{II}-azido chain along the *c* direction with the shortest Cd···Cd separation being 3.764 (3) Å.

The adjacent Cd^{II}-azido chains are mediated by interchained π-π stacking interactions between the aromatic rings of 1,10-phenanthroline molecules, which arrange in the opposite direction alternatively. The centroid-to-centroid distance between the central rings of the phenanthroline is 3.408 (2)Å and the centroid-to-plane distance is 3.28 Å leading to a slippage of 0.936Å. This π-π stacking builts up a 2-D supramolecular layer parallel to the *bc* plane (Fig. 2).

Experimental

A mixture of $Cd(NO_3)_2.4H_2O$ (0.308 g, 1.00 mmol), NaN_3 (0.065 g, 1.00 mmol), Na(3-cba) (0.085 g, 0.50 mmol 3-Hcba = 3-cyanobenzoate acid), 1,10-phenanthroline (0.099 g, 0.50 mmol) and H_2O (8 ml) was placed in a Teflon-lined stainless container, and then heated at 453 K for 2 days, after cooled to room temperature for 2 days. Pale-yellow prism-shaped crystals of the title compound were obtained. IR peaks (KBr, cm^{-1}): 2053 s, 2037 s h, 1589 w, 1515 w, 1425 w, 1333 w, 1284 w, 846 m, 772 w, 727 m, 656 w. A strong band around 2053 cm^{-1} indicates the presence of the azido group.

Refinement

Hydrogen atoms were allowed to ride on their respective parent atoms with C—H distances of 0.93 Å, and were included in the refinement with isotropic displacement parameters $U_{iso}(H) = 1.2U_{eq}(C)$.

Figures

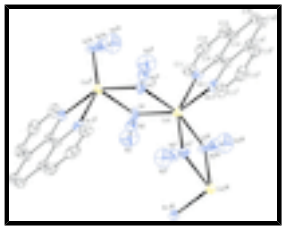

Fig. 1. View of the title compound with the atom labeling scheme. Ellipsoids are drawn at the 30% probability level. H atoms have been omitted for clarity.[Symmetry codes: (i) -*x*+1, *y*, -*z*+1/2; (ii) -*x*+1, -*y*+2, -*z*; (iii) *x*, -*y*+2, *z*+1/2; (iv) x, -y+2, z-1/2].

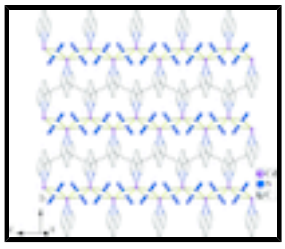

Fig. 2. View of the 2-D layer structure of the title compound formed by 1-D Cd^{II}-azido chains linked through π-π stacking interactions (black dotted lines) between symetry related 1,10-phenanthroline molecules. Hydrogen atoms have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.020$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.056$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0373P)^2 + 0.2202P]$ where $P = (F_o^2 + 2F_c^2)/3$
1217 reflections	$(\Delta/\sigma)_{max} = 0.001$
96 parameters	$\Delta\rho_{max} = 0.78$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.48$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 18 May 2010; accepted 27 May 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.002 Å; R factor = 0.034; wR factor = 0.098; data-to-parameter ratio = 13.0.

In the title compound, $C_{11}H_{11}NO_3$, the conformation of the N—H bond is *anti* to the C=O bond in the amide segment, while it is *syn* to the *ortho*-methyl group in the phenyl ring. In the maleamic acid unit, the amide C=O bond is *anti* to the adjacent C—H bond, while the carboxyl C=O bond is *syn* to the adjacent C—H bond. The C=O and O—H bonds of the acid group are in the relatively rare *anti* position to each other. This is an obvious consequence of the intramolecular O—H···O hydrogen bond donated to the amide carbonyl group. The *ortho*-substituted phenyl ring makes a dihedral angle of 12.7 (1)° with the mean plane of the maleamic acid unit. In the crystal structure, intermolecular N—H···O hydrogen bonds link the molecules into zigzag chains parallel to [001]. These chains are further linked into sheet by weak π–π interactions [centroid–centroid distance = 3.425 (2) Å].

N-(2-Methylphenyl)maleamic acid

B. T. Gowda, M. Tokarcík, K. Shakuntala, J. Kozísek and H. Fuess

Comment

The amide moiety is an important constituent of many biologically significant compounds. As a part of studying the effect of ring and side chain substitutions on the crystal structures of this class of compounds (Gowda *et al.*, 2009*a,b,c*; Prasad *et al.*, 2002), the crystal structure of *N*-(2-methylphenyl)-maleamic acid (I) has been determined (Fig. 1). The conformations of the N—H and the C=O bonds in the amide segment are *anti* to each other. But the conformation of the N—H bond is *syn* to the *ortho*-methyl group in the phenyl ring. In the maleamic acid moiety, the amide C=O bond is *anti* to the adjacent C—H bond, while the carboxyl C=O bond is *syn* to the adjacent C—H bond. The observed rare *anti* conformation of the C=O and O—H bonds of the acid group is similar to that obsrved in *N*-(2,6-dimethylphenyl)-maleamic acid (Gowda *et al.*, 2009*a*), *N*-(3,4-dimethylphenyl)-maleamic acid (Gowda *et al.*, 2009*b*) and *N*-(2,4,6-trimethylphenyl)- maleamic acid (Gowda *et al.*, 2009*c*).

The *ortho*-substituted phenyl ring makes a dihedral angle of 12.7 (1)° with the mean plane of the maleamic acid moiety (atoms C1, C2, C3, C4, N1, O1, O2 and O3). The orientation of the central amide group –NHOC– with respect to the phenyl ring is partially affected by the intramolecular hydrogen bond C10—H10···O1(amide) and is given by the torsion angle C10—C5—N1—C1 = -17.3 (2)°. Short intramolecular hydrogen bond O—H···O (Table 1) is important characteristic of the maleamic acid moiety. The C2–C3 bond length of 1.330 (2)Å clearly indicates the double bond character. In the crystal structure, the intermolecular N–H···O hydrogen bonds, having the amide N1 atom as donor and carbonyl O3 atom of the carboxyl group as acceptor, link the molecules into zigzag chains running along the [0 0 1] direction. Due to weak π-π interaction between the phenyl and maleamic acid moieties the chains are assembled to form sheets parallel to the *bc*-plane. One mode of the chain coupling is shown in Fig. 2 as a short contact between the phenyl ring centroid *Cg* and the C4 atom of the carboxylic group at (-*x*,-*y* + 1,-*z* + 1).

The various modes of interlinking carboxylic acids by hydrogen bonds is described elsewhere (Leiserowitz, 1976). The packing of molecules involving dimeric hydrogen bonded association of each carboxyl group with a centrosymmetrically related neighbor has also been observed (Jagannathan *et al.*, 1994).

Experimental

The solution of maleic anhydride (0.025 mol) in toluene (25 ml) was treated dropwise with the solution of 2-methylaniline (0.025 mol) also in toluene (20 ml) with constant stirring. The resulting mixture was stirred for about 30 min and set aside for an additional 30 min at room temperature for the completion of reaction. The mixture was then treated with dilute hydrochloric acid to remove the unreacted 2-methylaniline. The resultant solid *N*-(2-methylphenyl)maleamic acid was filtered under suction and washed thoroughly with water to remove the unreacted maleic anhydride and maleic acid. It was recrystallized to constant melting point from ethanol. The purity of the compound was checked by elemental analysis and characterized by its infrared spectra. The single crystals used in X-ray diffraction studies were grown in an ethanol solution by slow evaporation at room temperature.

Refinement

All H atoms attached to C atoms, N atom and O atom were fixed geometrically and treated as riding with C—H = 0.96 Å (methyl) or 0.93 Å (aromatic), N—H = 0.86 Å and O—H= 0.92Å with U_{iso}(H) = 1.2U_{eq}($C_{aromatic}$, N) or U_{iso}(H) = 1.5U_{eq}(C_{methyl}, O).

Figures

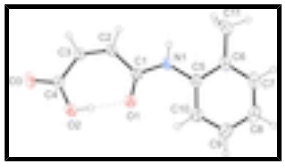

Fig. 1. Molecular structure of (I) showing the atom labelling scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms are represented as small spheres of arbitrary radii.

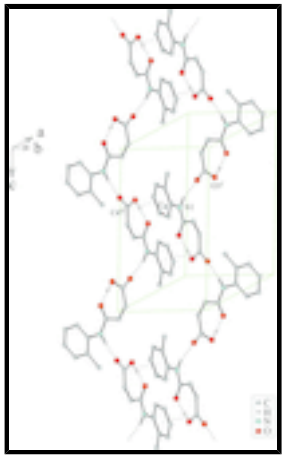

Fig. 2. Part of the crystal structure of (I) showing the zigzag chains generated by N—H···O hydrogen bonds and extending parallel to the *c* axis. The chains are weakly coupled by π-π interaction between the phenyl rings and maleamic acid groups. The dashed lines depict the hydrogen bonds, the dotted line depicts the short contact *Cg*···C4^{ii}. H atoms not involved in hydrogen bonding have been omitted. [Symmetry codes (i): *x*, -*y* + 3/2, *z* - 1/2; (ii) -*x*,-*y* + 1,-*z* + 1].

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.038; wR factor = 0.096; data-to-parameter ratio = 17.7.

The title compound, $C_8H_{11}O_2P$, is a phosphinic compound with a tetracoordinate pentavalent P atom. The phosphinic function plays a predominant role in the cohesion of the crystal structure, both by forming chains along the b axis *via* strong intermolecular O—H···O hydrogen bonds and by cross-linking these chains perpendicularly *via* weak intermolecular C—H···O hydrogen bonds, generating a two-dimensional network parallel to (001).

Benzyl(methyl)phosphinic acid

C. Fougère, E. Guénin, P. Retailleau and C. Barbey

Comment

The title compound, $C_8H_{11}O_2P$, belongs to the phosphinic acid family (*R*'P(O)OHR"). These compounds are important substrates in the study of biochemical processes, and those comprising tetracoordinate pentavalent phosphorus are widely used as biologically active compounds. Mimics of amino acids in which the carboxylic function is replaced by phosphorus analogues have attracted particular interest. Among these phosphorus functions, phosphinic acid moiety is an excellent mimic of the tetrahedral transition state of amid bond hydrolysis and is more stable than phosphonic or phosphonamidic isosters. Thus, phosphinic compounds occupy an important place and reveal diverse and interesting biological and biochemical properties (Ye *et al.*, 2007; Abrunhosa-Thomas *et al.*, 2007; Wang *et al.*, 2009): phosphinic peptides have been reported to be potent inhibitors of several matrixins (MMPs) (Matziari *et al.*, 2004) and are widely studied as antibacterial agents, enzyme inhibitors, haptens for catalytic antibodies, or anti HIV agents (Boyd *et al.*, 1994; Ryglowski & Kafarski, 1996).

The development of methods for the preparation of phosphinic acids is so important and currently attracting growing interest (Montchamp, 2005; Dingwall *et al.*, 1989). The most commonly employed methods to prepare phosphinic acids suffer from several limitations: large excess of reagents, difficulties to avoid formation of symmetrically disubstituted phosphinic acids, handling difficulties of some starting materials. A new synthesis of unsymmetrical phosphinic acids *R*'P(O)OHR" was performed. The first P—C bond formation was achieved using a base-promoted H-phosphinate alkylation from a protected H-phosphinate, easier and safer to handle. A one pot methodology was developed for the second P–C bond formation involving sila-Arbuzov reaction (Fougère *et al.*, 2009).

An *ORTEP* plot of the molecule is given in Fig. 1. Geometric parameters are in the usual ranges, *e.g.*; typical P = O, P—O and P—C bonds as it was found earlier in phosphonic acid crystal structures (Langley *et al.*, 1996; Frantz *et al.*, 2003; Meyer *et al.*, 2003; Cai *et al.*, 2003).

In the crystal packing, one molecule is linked to two adjacent symmetric molecules *via* strong intermolecular O–H···O==P hydrogen bonds (Table 1). These hydrogen bonds between phosphinic groups built an infinite intermolecular hydrogen-bond network along the *b* direction (Fig. 2), forming chains of molecules. These chains are perpendicularly cross-linked *via* weak hydrogen bonds between C-H from the aromatic ring and O from the phosphinic group (Table 1, Fig 2), that give rise to a bidimensionnal organization parallel to the (001) plane. The packing of the structure can also be described as a bidimensionnal organization piled up to the third direction with hydrophobic functions face to face.

Experimental

To benzyl phosphinate (20 mmol) in acetonitrile (20 ml), bromotrimethylsilane (7 equiv) was added under argon bubbling. The triethylamine (2 equiv) was added, followed 5 minutes later by the bromide derivatives (1 equiv). The mixture was cooled to 0°C and absolute ethanol was added to quench the reaction. After 30 min., the solvent was removed and the residue was taken up in distilled water and extracted with ethyl acetate. The organic layer was dried under $MgSO_4$; filtrated and evaporated under reduced pressure to give the crude product. This product was taken up in water (20 ml) and washed with

ether (3 *x* 20 ml), followed by a reversed phase column chromatography (water/methanol 1:1) to give a white solid with high yield (76%). Single crystals suitable for X-ray structure analysis could be obtained by slow evaporation of a concentrated water/methanol (1/1) solution at room temperature.

Refinement

All Hydrogen atoms attached to C atoms were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic), 0.96 Å (methylene) or 0.97 Å (secondary CH2 group) with U_{iso}(H) = 1.2 U_{eq}(C) (aromatic) or 1.5 U_{eq}(C) for others. H atom of the hydroxyl was located in difference Fourier syntheses and was treated in the last stage of refinement as riding on it parent O atom with O—H = 0.82 Å and U_{iso}(H) = 1.2 U_{eq}(O).

Figures

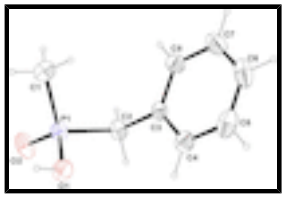

Fig. 1. Molecular View of the title compound. Displacement ellipsoids are drawn at the 30% probability level.

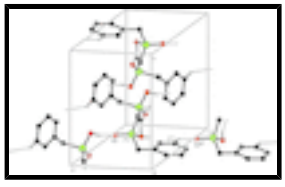

Fig. 2. Molecular packing view with intermolecular hydrogen bonds drawn as dashed lines. H atoms not involved in hydrogen bondings have been omitted for clarity. [Symmetry codes: (i) -*x*+1, *y*+1/2, -*z*+1/2; (ii) *x*-1, *y*, *z*]

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.096$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0381P)^2 + 0.2898P]$ where $P = (F_o^2 + 2F_c^2)/3$
1767 reflections	$(\Delta/\sigma)_{max} < 0.001$
100 parameters	$\Delta\rho_{max} = 0.18$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.29$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Hydrogen bis[2-(4-ammoniophenoxy)-acetate] triiodide

Wen-Xiang Wang

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 211189, People's Republic of China
Correspondence e-mail: wxwang_1109@yahoo.cn

Received 4 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.028; wR factor = 0.062; data-to-parameter ratio = 19.4.

In the title compound, $C_{16}H_{19}N_2O_6^+\cdot I_3^-$, the carboxylate groups of a pair of (4-aminophenoxy) acetate ligands are bridged by an H atom in a rather classical configuration. The H atom is located on an inversion center and the pair of carboxylate groups are centrosymmetrically related with an O···O distance of 2.494 (5) Å. The I_3^- anion is also located on an inversion center. In the crystal, N—H···O and N—H···I hydrogen-bond interactions build up a three-dimensionnal network.

Hydrogen bis[2-(4-ammoniophenoxy)acetate] triiodide

W.-X. Wang

Comment

We are interested in the dielectric-ferroelectric materials, including organic ligands (Li *et al.*,2008), metal-organic coordination compounds (Hang *et al.*, 2009) and organic-inorganic hybrids. Recent studies have revealed that in amino acid-inorganic acid complexes, when the number of H atoms liberated from the inorganic acid is less than the number of amino acids, the H atom is shared by two amino acids, resulting in short symmetric O—H···O hydrogen bonds, as evidenced in triglycine sulfate (Kay *et al.*, 1977), leading to phase transitions. Thus, we want to find aromatic compounds containing amidogens having dielectric-ferroelectric properties. As part of our ongoing studies, we report here the crystal structure of the title compound.

In the title compound, $C_{16}H_{19}N_2O_6^+.I_3^-$, the carboxylate groups of a pair of (4-aminophenoxy) acetate are bridged by a proton (Fig. 1) as already observed in many carboxylate derivative (Antolic *et al.*, 1999; Bacon *et al.*,1977; Chen & Mak, 1994; Godzisz *et al.*, 2003; Kay, 1977; Li *et al.*, 1998; McAdam *et al.*,1971; Pogorzelec & Garbarczyk, 2002; Sridhar *et al.*, 2001; Videnova-Adrabinska *et al.*, 2007; Zhu *et al.*, 2002). The proton is located on an inversion center and the pair of carboxylate groups are centrosymmetrically related with an O···O distance of ca 2.494 (5) Å. The two carboxylate frameworks are in the same plane with the largest deviation from the plane being 0.013 (3) Å. This plane is making a dihedral angle of 84.1 (1)° with the phenyl ring.

The anion I_3^- is also located around inversion center. The occurence of N-H···O and N-H···I hydrogen interactions build up a three dimensionnal network (Fig. 2).

Experimental

ethyl 2-(4-aminophenoxy)acetate (1.95 g) and methanol(30 ml) were added to a round-bottomed flask with a magnetic stirrer bar, then hydrofluoric acid(52%) 2.4 g was added into the mixture. Yellow plate-like crystals of (I) were grown from an ethanol solution of the title compound by slow evaporation at room temperature.

Refinement

All H atoms attached to C atoms and N atom were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic) or 0.97 Å (methylene) and N—H = 0.89 Å with $U_{iso}(H) = 1.2U_{eq}(C,N,O)$.

Figures

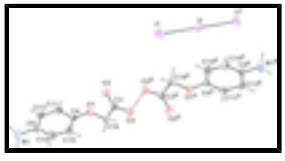

Fig. 1. The molecular structure of the title compound, with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii. [Symmetry codes : (i) -x+1, -y, -z+1; (ii) 1-x, 1-y, 1-z]

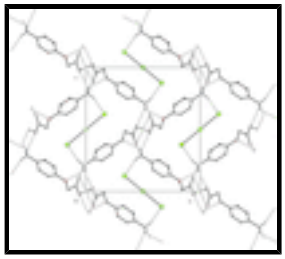

Fig. 2. Packing view of the title compound, the *a* axis. Dashed lines indicate hydrogen bonds. H atoms not involved in hydrogen bondings have been omitted for clarity.

$Z = 2$	

Data collection

Rigaku SCXmini diffractometer	2408 independent reflections
Radiation source: fine-focus sealed tube	2182 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.034$
Detector resolution: 13.6612 pixels mm^{-1}	$\theta_{max} = 27.5°$, $\theta_{min} = 3.1°$
ω scans	$h = -6 \rightarrow 6$
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)	$k = -17 \rightarrow 17$
$T_{min} = 0.52$, $T_{max} = 0.58$	$l = -19 \rightarrow 19$
10680 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.028$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.062$	H-atom parameters constrained
$S = 1.14$	$w = 1/[\sigma^2(F_o^2) + (0.0183P)^2 + 1.2671P]$ where $P = (F_o^2 + 2F_c^2)/3$
2408 reflections	$(\Delta/\sigma)_{max} = 0.002$

124 parameters	$\Delta\rho_{max}$ = 0.85 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.74 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 4 June 2010; accepted 13 June 2010

Key indicators: single-crystal X-ray study; T = 110 K; mean σ(C–C) = 0.001 Å; R factor = 0.043; wR factor = 0.115; data-to-parameter ratio = 22.9.

In the title molecule, $C_{15}H_{11}N_3$, the dihedral angle between the benzene ring and the fused pyrrole ring is 1.07 (5)°. The cyclohexene ring adopts an envelope conformation: the dicyanomethylene group at position 1 has a coplanar orientation. An intramolecular N—H···N hydrogen bond generates an S(7) ring motif. Intermolecular N—H···N hydrogen bonds form an R_2^2(14) ring in the crystal. A C—H···π interaction involving the benzene ring is also found in the structure.

R. Archana, K. Prabakaran, K. J. Rajendra Prasad, A. Thiruvalluvar and R. J. Butcher

Comment

Tetrahydrocarbazolones have been used extensively as advanced intermediates in synthetic efforts toward a number of naturally occurring carbazole alkaloids (Scott *et al.*, 2006). Carbazole alkaloids possess various biological activities such as anti-tumor, anti-oxidative, anti-mutagenic, and anti-inflammatory activities (Ramsewak *et al.*, 1999; Tachibana *et al.*, 2001; Nakahara *et al.*, 2002). Since it is known that carbazole alkaloids possess anti-tumor activity, the identification of alkaloids that are cytotoxic against tumor cells could lead to the development of a chemopreventive agent for tumor treatment.

Gunaseelan *et al.* (2007*a*,b), Gunaseelan *et al.* (2009), Thiruvalluvar *et al.* (2007) and Sridharan *et al.* (2008) have reported the crystal structures of substituted carbazole derivatives, in which the carbazole units are not planar. In the title molecule (Scheme I, Fig. 1), $C_{15}H_{11}N_3$, the carbazole unit is not planar. The dihedral angle between the benzene ring and the fused pyrrole ring is 1.07 (5)°. The r.m.s. deviation of a mean plane fitted through all non hydrogen atoms excluding C3 of the carbazole unit is 0.0263 Å; C3 deviates from this plane by 0.576 (1) Å. The cyclohexene ring adopts an envelope conformation. The puckering parameters (Cremer & Pople, 1975) are q2=0.3482 (10) Å, q3=-0.2564 (10) Å, Q=0.4324 (10) Å, θ=126.37 (13)° and φ=293.46 (16)°. The dicyanomethylene group at position 1 has a coplanar orientation. An intramolecular hydrogen contact N9—H9···N13 generates a ring of graph-set motif S(7) (Bernstein *et al.*, 1995)(Table 1, Fig. 1). Intermolecular N9—H9···N13 hydrogen bonds form a $R^2_2(14)$(Bernstein *et al.*, 1995) ring in the crystal structure (Table 1, Fig. 2). A C2—H2A···π interaction involving the benzene (C4B,C5—C8,C8A) ring is also found in the structure(Table 1).

Experimental

A mixture of 2,3,4,9-tetrahydro-1*H*-carbazol-1-one (0.199 g, 0.001 mol), malononitrile (0.066 g, 0.001 mol), ammonium acetate (0.092 g, 0.0012 mol) and few drops of acetic acid in 5 ml of toluene was refluxed at 383 K for 6 h. On cooling, the precipitate that formed was filtered off, washed with petroleum ether and dried. The crude product thus obtained was purified by column chromatography over silica gel using petroleum ether: ethyl acetate (99:1, *v*/*v*) to yield the titled product (0.173 g, 74%). This was recrystallized from ethyl acetate.

Refinement

The H atom bonded to N9 was located in a difference Fourier map and refined freely. Other H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.95–0.99 Å and U_{iso}(H) = 1.2U_{eq}(parent atom).

Figures

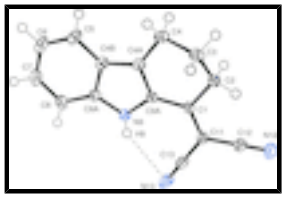

Fig. 1. The molecular structure of the title compound, showing the atom-numbering scheme and displacement ellipsoids drawn at the 50% probability level. H atoms are shown as small spheres of arbitrary radius.

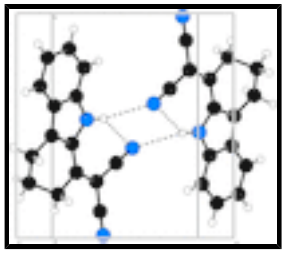

Fig. 2. A part of the crystal structure of (I), viewed along *c* axis, showing the formation of a $R^2_2(14)$ ring.

$V = 1158.92$ (8) Å^3	Prism, pale-yellow
$Z = 4$	0.53 × 0.38 × 0.31 mm

Data collection

Oxford Diffraction Xcalibur Ruby Gemini diffractometer	3822 independent reflections
Radiation source: Enhance (Mo) X-ray Source	2854 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.021$
Detector resolution: 10.5081 pixels mm^{-1}	$\theta_{max} = 32.6°$, $\theta_{min} = 4.7°$
ω scans	$h = -12 \rightarrow 12$
Absorption correction: multi-scan (*CrysAlis PRO*; Oxford Diffraction, 2009)	$k = -15 \rightarrow 15$
$T_{min} = 0.939$, $T_{max} = 1.000$	$l = -19 \rightarrow 16$
8311 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.115$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0736P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3822 reflections	$(\Delta/\sigma)_{max} = 0.001$
167 parameters	$\Delta\rho_{max} = 0.40$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.24$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 9 June 2010; accepted 14 June 2010

Key indicators: single-crystal X-ray study; T = 110 K; mean σ(C–C) = 0.008 Å; R factor = 0.045; wR factor = 0.152; data-to-parameter ratio = 15.4.

The title compound, $C_{15}H_{10}Br_2O$, is a chalcone with 2-bromophenyl and 4-bromophenyl rings bonded to opposite sides of a propenone group. The dihedral angle between mean planes of the benzene rings is 71.3 (1)°. The angle between the mean plane of the prop-2-ene-1-one group and the mean planes of the 2-bromophenyl and 4-bromophenyl rings are 64.2 (9) and 71.3 (1)°, respectively. A weak intermolecular C—H···O interaction and two weak C—Br···π interactions are observed, which contribute to the stability of the crystal packing.

Comment

Chalcones, or 1,3-diaryl-2-propen-1-ones, belong to the flavonoid family. Chemically they consist of open-chain flavonoids in which the two aromatic rings are joined by a three-carbon α,β-unsaturated carbonyl system. A vast number of naturally occurring chalcones are polyhydroxylated in the aryl rings. The radical quenching properties of the phenol groups present in many chalcones have raised interest in using the compounds or chalcone rich plant extracts as drugs or food preservatives (Dhar, 1981). Chalcones have been reported to possess many useful properties, including anti-inflammatory, antimicrobial, antifungal, antioxidant, cytotoxic, anticancer activities (Dimmock *et al.*, 1999). The crystal structures of closely related chalcones, *viz*., 1,3-bis(4-bromophenyl)prop-2-en-1-one (Ng *et al.*, 2006) and 3-(3-bromophenyl)-1-(4-bromophenyl)prop-2-en-1-one (Teh *et al.*, 2006) have been reported. Hence in continuation with the synthesis and crystal structure determination and also owing to the importance of these flavanoid analogs, this bromo chalcone, $C_{15}H_{10}Br_2O$, is synthesized and its crystal structure is reported.

The title compound, $C_{15}H_{10}Br_2O$, is a chalcone with 2-bromophenyl and 4-bromophenyl rings bonded to opposite sides of a propenone group (Fig. 2). The dihedral angle between mean planes of the benzene rings in the *ortho*-bromo and *para*-bromo substituted rings is 71.3 (1)°. The angle between the mean plane of the prop-2-ene-1-one group (C1/C7/O1/C8) and the mean planes of the benzene rings in the 2-bromophenyl (C1–C6) and 4-bromophenyl rings (C10–C15) are 64.2 (9)° and 71.3 (1)°, respectively. Bond distances and angles are in normal ranges (Allen *et al.*, 1987). While no classical hydrogen bonds are present, a weak intermolecular C12—H12A···O1 interaction (Table 1) and two weak π-ring intermolecular interactions (Table 2) are observed which contribute to the stability of crystal packing.

Experimental

A 50% KOH solution was added to a mixture of 2-bromo acetophenone (0.01 mol, 1.99 g) and 4-bromo benzaldehyde (0.01 mol, 1.85 g) in 25 ml of ethanol (Fig. 1). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. The single-crystal was grown from ethyl acetate by slow evaporation method and yield of the compound was 68% (m.p.373–375 K). Analytical data: Found (Calculated): C %: 49.19 (49.22%); H%: 2.73 (2.75%).

Refinement

The H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C–H distances = 0.95Å and with U_{iso}(H) = 1.17–1.22 U_{eq}(C).

Special details

Experimental. IR data (KBr) ν cm^{-1}: 3048 cm^{-1} (C—H str) 1671 cm^{-1} (C=O), 1685 cm^{-1} (C=C).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 93 K; mean σ(C–C) = 0.003 Å; R factor = 0.035; wR factor = 0.091; data-to-parameter ratio = 10.5.

The crystal structure of the title compound, $C_{34}H_{54}N_2O_4$, has been solved in order to prove the relative and absolute chirality of the newly-formed stereocentres which were established using an asymmetric Diels–Alder reaction at an earlier stage in the synthesis. This unprecedented stable dialdimine contains a 14-membered ring and was obtained as the minor diastereoisomer in the Diels–Alder reaction. The absolute stereochemistry of the stereocentres of the acetal functionality was known to be *R* based on the use of a chiral (*R*)-trisubstituted dienophile derived from enantiopure (*S*)-glyceraldehyde. The assignment of the configuration in the dienophile and the title di-aldimine differs from (*S*)-glyceraldehyde due to a change in the priority order of the substituents. The crystal structure establishes the presence of six stereocentres all attributed to be *R*. The 14-membered ring contains two aldimine bonds [C—N = 1.258 (2) and 1.259 (2) Å]. It adopts a similar conformation to that proposed for *trans–trans*-cyclotetradeca-1,8-dienes.

Comment

The title spiro-di-aldimine was obtained as part of a synthetic program directed towards the synthesis of the spiroimine unit of the spirolides AD. This family of marine toxins were isolated from the digestive glands of contaminated mussels, scallops and toxic plankton from the East coast of Nova Scotia in Canada and are considered as fast-acting toxins (Hu *et al.*, 1995; Hu *et al.*, 2001; Gill *et al.*, 2003; Guéret & Brimble, 2010). The work demonstrates a new method to access an enantiopure spiro-di-aldimine and an enantiopure bicyclic ketimine in good overall yield. The synthesis of the spiroimine is a synthetic challenge and to date the synthesis of the 7,6-spiroimine moiety of the spirolides has not been achieved. By reaction of a chiral (*R*)-trisubstituted dienophile derived from (*S*)-glyceraldehyde with Danishefsky's diene (Asano *et al.*, 2006; Danishefsky *et al.*, 1990; Petrzilka & Grayson, 1981), the resultant Diels-Alder adducts were afforded as a mixture of 3 diastereoisomers in a 5:2:1 ratio. The undesired minor diastereoisomer was used to develop the synthetic route to the desired spiroaldimine. The Diels-Alder adduct was converted to the spiroimine precursor in several steps. Reaction of this advanced azido-aldehyde intermediate with triphenylphosphine surprisingly afforded the stable title dimer instead of the expected 7,6-bicyclic aldimine. The stability of the title dimer is unexpected compared to the known instability of aldimines in general. Given that the stereochemistry at C26 and C32 is known to be *R* (based on using enantiopure (*S*)-glyceraldehyde as the starting material), the absolute configuration at C1, C6, C13 and C20 has therefore also been assigned as *R*. The assignment of configuration of the trisubstituted dienophile and the title di-aldimine differs from the starting (*S*)-glyceraldehyde due to a change in the priority order of substituents.

The molecular structure, Fig. 1, indicates that the acetal unit and the imine part adopt an axial position in both cyclohexane rings. The 14-membered ring contains two aldimine bonds(C14—N15 1.258 (2),C7—N8 1.259 (2)). It adopts a similar conformation to that proposed for *trans-trans* cyclotetradeca-1,8-dienes (Dale, 1966) except for an alternate conformation for C17, C18 and C19. A 14-membered *tetra*-azacyclotetradeca-1,8-diene which has *R* and *S* centres shows similar conformational characteristics (Allmann, 1974). The diazaspirocyclotetradecan-7,14-ene molecules assemble in the crystal in linear arrays. Each ring is offset with the six membered rings from a neighbouring molecule aligned over the ring centre, Fig. 2.

Experimental

To 2-(2",2"-dimethyl-1",3"-dioxolan-4"-yl)-4-methylene-1-(4'-azidobutyl)cyclohexane carbaldehyde (7.8 mg, 24 µmol) in toluene-d8 (0.6 ml) was added triphenylphosphine (6.3 mg, 24 µmol). The resulting mixture was stirred for 1 h at room temperature then warmed to 55 °C and stirred at this temperature for 17 h. After cooling to room temperature, the mixture was concentrated in vacuo. The crude imine was purified by column chromatography (20: 80 EtOAc–hexanes) to give the *title compound* (4.6 mg, 71%) as a white crystalline solid. Dilution in CH_2Cl_2/hexanes (1: 1, 2 ml) and slow evaporation of the solvent afforded white prisms.

M. P. 171.8–172.3 °C.

HRMS (ESI) calculated for $C_{34}H_{55}N_2O_4$ $[M + H]^+$: 555.4156, found 555.4143.

m/z (ESI-MS) 195 ($[M]^+$, 100), 278 (40), 220 (12%).

$[\alpha]_D^{20}$ -25.5 (c 1/5, CH_2Cl_2).

Refinement

In the absence of significant anomalous scattering, the absolute configuration could not be reliably determined from the X-ray analyses and then the Friedel pairs were merged and any references to the Flack parameter were removed.

Atoms were placed in calculated positions and a riding model (C–H = 0.93 or 0.97 Å), with U_{iso}(H) = 1.2 or 1.5 times U_{eq}(C) was used during refinement.

Figures

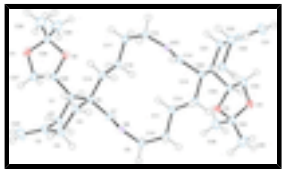

Fig. 1. The molecular view of the title compound with the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

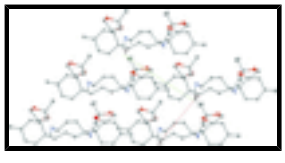

Fig. 2. The molecular packing diagram of the title compound, viewed along *c* axis. The hydrogen atoms have been omitted for clarity.

(1*R*,6*R*,13*R*,18*R*)-(*Z*,*Z*)- 1,18-Bis[(4*R*)-2,2-dimethyl-1,3-dioxolan-4-yl]-3,16-dimethylene- 8,20-diazadispiro[5.6.5.6]tetracosa-7,19-diene

Crystal data

$C_{34}H_{54}N_2O_4$	$Z = 1$
$M_r = 554.80$	$F(000) = 304$
Triclinic, $P\overline{1}$	$D_x = 1.145$ Mg m^{-3}
Hall symbol: P -1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 6.8710$ (1) Å	Cell parameters from 6455 reflections
$b = 10.1701$ (2) Å	$\theta = 1.8$–$27.9°$
$c = 11.7947$ (2) Å	$\mu = 0.07$ mm^{-1}

$\beta = 88.043$ (1)°	Needle, colourless
$\gamma = 83.855$ (1)°	0.36 × 0.19 × 0.1 mm
$V = 804.71$ (2) Å^3	

Data collection

Siemens SMART CCD diffractometer	3555 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.042$
graphite	$\theta_{max} = 27.9°$, $\theta_{min} = 1.8°$
ω scans	$h = -9 \rightarrow 9$
19146 measured reflections	$k = -13 \rightarrow 13$
3824 independent reflections	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.035$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.091$	H-atom parameters constrained
$S = 0.92$	$w = 1/[\sigma^2(F_o^2) + (0.0645P)^2 + 0.1019P]$ where $P = (F_o^2 + 2F_c^2)/3$
3824 reflections	$(\Delta/\sigma)_{max} < 0.001$
365 parameters	$\Delta\rho_{max} = 0.28$ e Å^{-3}
3 restraints	$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger. Three restraints for a floating origins were used.

Received 11 June 2010; accepted 18 June 2010

Key indicators: single-crystal X-ray study; T = 296 K, P = 0.0 kPa; mean σ(C–C) = 0.002 Å; R factor = 0.051; wR factor = 0.151; data-to-parameter ratio = 18.5.

In the molecule of the title compound, $C_{12}H_{12}N_2O$, the quinoxaline ring is planar with an r.m.s. deviation of 0.007 (15) Å. The dihedral angle between the quinoxaline and propenyl planes is 82.1 (2)°. The crystal packing is stabilized by offset π–π stacking between the quinoxaline rings [centroid–centroid distance = 3.8832 (9) Å].

Related literature

3-Methyl-1-(prop-2-en-1-yl)quinoxalin-2(1*H*)-one

Y. Ramli, R. Slimani, H. Zouihri, S. Lazar and E. M. Essassi

Comment

Quinoxaline derivatives are a very important class of nitrogen-containing compounds and have been widely used in dyes, pharmaceuticals and electrical/photochemical materials. Quinoxaline ring moiety constitute part of the chemical structures of various antibiotics such as Echinomycin, Levomycin and Actinoleutin that are known to inhibit growth of gram positive bacteria and are active against various transplantable tumors.

Quinoxaline derivatives were found to exhibit antimicrobial [Kleim *et al.* 1995], antitumor [Abasolo *et al.* 1987], and antituberculous activity [Rodrigo *et al.*2002]. They, also, exhibit interesting antifungal, herbicidal, Antidyslipidemic and antioxidative activities of quinoxaline derivatives, see: (Jampilek *et al.* 2005, Sashidhara *et al.* 2009, Watkins *et al.* 2009).

The dihedral angle between the quinoxaline and propenyl planes is 82.1 (2) (Fig. 1). Bond lengths and angles in title molecule are normal (Allen *et al.*, 1987). The crystal packing is stabilized by offset π-π stacking between the quinoxalin rings.

Experimental

To a solution of 3-methylquinoxali-2(1*H*)-one (1 g) in 20 ml of dimethylformamide was added allylchloride (0.85 ml),K2CO3 (0.95 g) and catalytic amont of tetrabutylammonium bromide.The mixture was stirred at room temperature for 24 h.Then the solvent was remdove under reduce pressure,the residue was cristallized in ethanol to afford the product.

Refinement

Although found in a difference map, H atoms were introduced in calculated positions and treated as riding with C—H = 0.96 Å for methyl groups, C—H = 0.93 Å for aromatic and C—H = 0.97 Å for methine with U iso (H) = 1.2U_{eq} (aromatic, methine) or U iso (H) = 1.5U_{eq} (methyl).

Figures

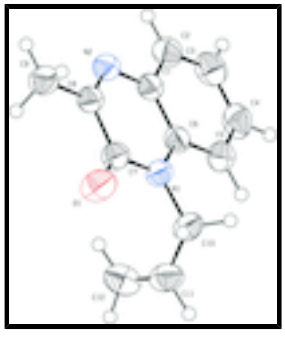

Fig. 1. : Molecular structure of the title compound with the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

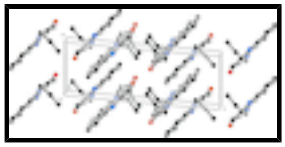

Fig. 2. : Packing view of the crystal structure of the title compound.

Crystal data

$C_{12}H_{12}N_2O$	$F(000) = 424$
$M_r = 200.24$	$D_x = 1.298$ Mg m^{-3}
Monoclinic, $P2_1/c$	Melting point: 1486 K
Hall symbol: -P 2ybc	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 5.0722$ (5) Å	Cell parameters from 2764 reflections
$b = 13.4707$ (13) Å	$\theta = 2.4$–$27.4°$
$c = 15.0507$ (13) Å	$\mu = 0.09$ mm^{-1}
$\beta = 95.082$ (5)°	$T = 296$ K
$V = 1024.31$ (17) Å^3	Block, colourless
$Z = 4$	0.32 × 0.31 × 0.13 mm

Data collection

Bruker X8 APEXII CCD area-detector diffractometer	1726 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.049$
graphite	$\theta_{max} = 28.3°$, $\theta_{min} = 2.7°$
φ and ω scans	$h = -6\rightarrow6$
11850 measured reflections	$k = 0\rightarrow17$
2546 independent reflections	$l = 0\rightarrow20$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.151$	H-atom parameters constrained
$S = 1.08$	$w = 1/[\sigma^2(F_o^2) + (0.0723P)^2 + 0.0888P]$ where $P = (F_o^2 + 2F_c^2)/3$
2546 reflections	$(\Delta/\sigma)_{max} = 0.001$
137 parameters	$\Delta\rho_{max} = 0.23$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.17$ e Å^{-3}

Special details

Experimental. The data collection nominally covered a sphere of reciprocal space, by a combination of seven sets of exposures; each set had a different φ angle for the crystal and each exposure covered 0.5° in ω and 30 s in time. The crystal-to-detector distance was 37.5 mm.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimatedusing the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL datawill be even larger.

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.049; wR factor = 0.135; data-to-parameter ratio = 18.9.

The title compound, $C_{18}H_{23}N_2Si^+\cdot Cl^-\cdot H_2O$, was synthesized from 1-[(trimethylsilyl)methyl]benzimidazole and benzyl chloride in dimethylformamide. The benzimidazole ring system is approximately planar, with a maximum deviation of 0.022 (2) Å, and makes an angle of 74.80 (12)° with the phenyl ring. The crystal packing is stabilized by O—H···Cl, C—H···Cl, C—H···O and C—H···π interactions between symmetry-related molecules together with π–π stacking interactions between the imidazolium and benzene rings [centroid–centroid distance = 3.5690 (15) Å] and between the benzene rings [centroid–centroid distance = 3.7223 (14) Å].

1-Benzyl-3-[(trimethylsilyl)methyl]benzimidazolium chloride monohydrate

M. Akkurt, Í. Çelik, H. Küçükbay, N. Sireci and O. Büyükgüngör

Comment

Although there are different antibacterial and antifungal drugs used in the treatment of bacterial and fungal infections, some of them have undesirable side effects. In addition, some of them become less effective due to the development of resistance to these drugs (Williams *et al.*, 2002). Therefore, many clinically effective antibacterial and antifungal drugs have become less effective due to the development of resistance to these drugs. Since, benzimidazole compounds have been found to have a broad range of pharmacological activity, many research groups as well as our group have been interested in these type of heterocyclic compounds (Singh *et al.*, 2000; Huang *et al.* 2006; Turner & Denny, 1996; Lukevics *et al.*, 2001; Galal *et al.* 2009; Çetinkaya *et al.*, 1996; Küçükbay *et al.*, 1995, 1997, 2003, 2004, 2010; Yılmaz & Küçükbay, 2009; Tavman *et al.*, 2005). In recent years, considerable attention has been given to the synthesis of alkylsilyl substituted benzimidazole derivatives because of their properties in cancer therapy. For example, 1-(3-trimethylsilylpropyl)benzimidazole inhibits carcinoma S-180 tumour growth in dose 1 mg.kg^{-1} by 62% (on ICR mice) (Lukevics *et al.*, 2001). These properties of silylsubstituted benzimidazole compounds, triggered us to synthesis novel trimethylsilyl substituted benzimidazole compounds. The objectives of this study were to synthesize and elucidate the crystal structure of the title compound, 1-benzyl-3-trimethylsilylmethylbenzimidazolium chloride monohydrate, (I).

In the title molecule, (Fig. 1), the benzimidazole ring system (N1/N2/C1–C7) is approximately planar, with maximum deviations of -0.022 (2) Å for C6, -0.018 (2) for C1 and 0.015 (2) for C7. The benzimidazole (N1/N2/C1–C7) and phenyl (C9–C14) systems make an angle of 74.80 (12)°. The values of the geometric parameters in (I) are comparable with those observed for other similar compounds (Akkurt *et al.*, 2008, 2010). The average value of the Si—C bond length is 1.854 (4) Å. The angles around the Si atoms with a distorted tetrahedral geometry rang from 105.86 (16)° to 111.81 (16)°.

The crystal packing of (I) is stabilized by O—H···Cl, C—H···Cl and C—H···π interactions between symmetry-related molecules (Fig. 2 and Table 1), together with π-π stacking interactions between imidazolium and benzene (Table 2).

Experimental

A mixture of 1-trimethylsilylmethylbenzimidazole (1.02 g, 5 mmol) and benzyl chloride (0.60 cm^3, 5 mmol) in dimethylformamide (5 ml) was refluxed for 3 h. The mixture was then cooled and the volatiles were removed *in vacuo*. The residue was crystallized from a dimethylformamide/ethanol (1:1). White crystals of the title compound (1.36 g, 82%) were obtained, m.p. 425–426 K; $\nu_{(CN)}$ = 1553 cm^{-1}. Anal. Found: C 61.64, H 7.19, N 7.93%. Calculated for $C_{18}H_{25}ClN_2OSi$: C 61.96, H 7.22, N 8.03%. ^{1}H NMR (δ, DMSO-d$_6$): 10.21 (s, 1H, NCHN), 8.11 - 7.59 (m, 4H, C_6H_4), 7.56–7.33 (m, 5H, C_6H_5), 5.86 (s, 2H, CH_2 benzyl), 4.30 (s, 2H, CH_2Si) and 0.14 [s, 9H, $(CH_3)_3Si$]. ^{13}C NMR (δ, DMSO-d$_6$): 141.6 (NCHN), 134.6, 132.1, 130.8, 129.1, 128.8 and 128.3 (C_6H_4), 126.8, 126.5, 114.3 and 113.9 (C_6H_5), 49.8 (CH_2 benzyl), 38.1(CH_2Si) and -2.5 [$(CH_3)_3Si$].

Refinement

All H atoms attached to C atoms were fixed geometrically and treated as riding with C—H = 0.93 Å (aromatic), 0.96 Å (methyl) and 0.97 Å (methylene) with U_{iso}(H) = 1.2U_{eq}(C) or 1.5U_{eq}(methyl). H atoms of water molecule were located in difference Fourier maps and included in the subsequent refinement using restraints (O-H= 0.83 (1)Å and H···H= 1.40 (2)Å) with U_{iso}(H) = 1.5U_{eq}(O).In the last cycles of refinement, they were treated as riding on the O atoms.

Figures

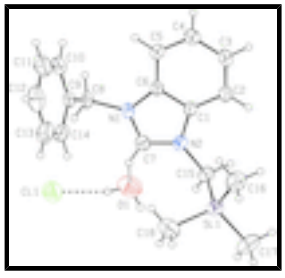

Fig. 1. View of the title molecule in the asymmetric unit, with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii and H bonds are shown as dashed lines.

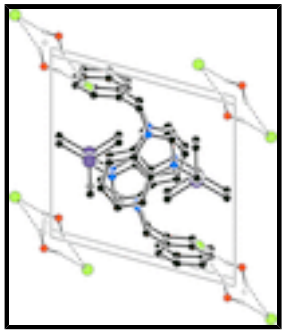

Fig. 2. View of the packing and hydrogen bonding interactions of (I) down the *b* axis. All hydrogen atoms not involved in hydrogen bonding have been omitted for clarity.

1-Benzyl-3-[(trimethylsilyl)methyl]benzimidazolium chloride monohydrate

Crystal data

$C_{18}H_{23}N_2Si^+·Cl^-·H_2O$	Z = 2
M_r = 348.94	F(000) = 372
Triclinic, $P\overline{1}$	D_x = 1.203 Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, λ = 0.71073 Å
a = 9.3592 (7) Å	Cell parameters from 28124 reflections
b = 10.9500 (9) Å	θ = 2.1–28.0°
c = 11.0522 (8) Å	μ = 0.27 mm^{-1}
α = 117.594 (6)°	T = 296 K
β = 103.295 (6)°	Prism, colourless
γ = 92.094 (6)°	0.57 × 0.50 × 0.36 mm
V = 963.39 (15) Å^3	

Data collection

Stoe IPDS 2 diffractometer	3987 independent reflections
Radiation source: sealed X-ray tube, 12 x 0.4 mm long-fine focus	3241 reflections with $I > 2\sigma(I)$
plane graphite	$R_{int} = 0.029$
Detector resolution: 6.67 pixels mm^{-1}	$\theta_{max} = 26.5°$, $\theta_{min} = 2.1°$
ω scans	$h = -11 \rightarrow 11$
Absorption correction: integration (*X-RED32*; Stoe & Cie, 2002)	$k = -13 \rightarrow 12$
$T_{min} = 0.859$, $T_{max} = 0.909$	$l = -13 \rightarrow 13$
12149 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.049$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.135$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0637P)^2 + 0.2683P]$ where $P = (F_o^2 + 2F_c^2)/3$
3987 reflections	$(\Delta/\sigma)_{max} < 0.001$
211 parameters	$\Delta\rho_{max} = 0.32$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.32$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

(2-Decanamidoethyl)dimethylamine *N*-oxide

Agnieszka Lewińska

Faculty of Chemistry, Wrocław University, ul. Joliot-Curie 14, 50-383 Wrocław, Poland
Correspondence e-mail: lewinska@eto.wchuwr.pl

Received 20 May 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.033; wR factor = 0.094; data-to-parameter ratio = 18.6.

In the title compound, $C_{14}H_{30}N_2O_2$, the almost planar nonyl chains are fully extended: the N—C—C—N torsion angle of −161.95 (8)° indicates an *anti* conformation. The crystal structure features N—H···O hydrogen bonds and C—H···O interactions.

(2-Decanamidoethyl)dimethylamine *N*-oxide

A. Lewinska

Comment

Surfactants are amphiphilic molecules composed by at least two parts, one of them is polar or hydrophilic and the other one nonpolar or hydrophobic. A special group of surface active amine oxides are amidoamine oxides based on fatty monocarboxylic acids and diamines, particularly *N*,*N*-dimethylethylenediamine and *N*,*N*-dimethyl-1,3-propanediamine. These surfactants are typically employed in hair and body care, cleaning and shampoo formulations as foaming agents, wetting agents, thickeners and conditioners They are low or nontoxic to humans and higherorganisms but at the same time exhibit an antimicrobial activity.

The crystal and molecular structure of typical N-oxide derivatives were previously determined for 17-oxosparteine N(*l*)-oxide hydrochloride (A. Katrusiak, *et al.*) and 4-methylpyridine-N-oxide (L.Palatinus *et al*.). The crystal and molecular structure recognized for N-oxide surfactant, *N*,*N*-dimethyl-n-tetradecylamine oxide (Fronczek *et al.*), in some degree is similar to the structure of our compound**.** In general, N-oxide derivatives and especially N-oxide surfactants are known as very difficult for crystallization, so the crystal structure solution for 2-(decanoylamino)ethyldimethylamine-N-oxide presented in this report is a very rare case.

The title compound consists of a hydrophobic alkyl chain and a lipophilic moiety represented by amide and N-oxide groups bridged by ethyl group (Figure 1). The planar nine carbon side adopt fully extended conformations and is twisted 45.6 (1)° from the plane of adjacent amide moiety. The torsion angle N1—C1—C2—N2 of -161.95 (8)° shows that this part takes an antiperiplanar conformation. The bond lengths and angles of nonyl chain Low *et al.* (1999) and amide group Belicchi-Ferrari *et al.* (2007) are within the normal ranges and comparable to the previously reported structures. The N—O bond length of is slightly shorter than the corresponding distances in tertiary acyclic amine oxides Boese *et al.* (1999).

The crystal structures is composed of the alternated hydrophilic and hydrophobic layers (Figure 1). The components in the hydrophilic parts are linked to each other *via* N—H···O bonds of R2,2(10) ring motifs Ulrich *et al.* (1990) and the weak C—H···O interactions (Table 2), whereas in the hydrophobic regions they interact through van der Waals contacts.

Experimental

A title compound was synthesized according to method given by Piłakowska-Pietras *et al.* (2008) The surfactant was carefully purificated several times. Suitable single crystalwere obtained by slow evaporation of thecompoundsolutionin a chloroform–hexane mixture and kept cold at -5^{-}C. The crystals of 2-(decanoylamino)ethyldimethylamine-N-oxides appeared unexpectedly taking into account well known problems with the surfactants crystallization.

Refinement

All the H atoms were positioned geometrically and refined using a riding model with C—H = 0.98–0.99 Å. The U_{iso} values were constrained to be -1.5U_{equ} (methyl H atoms) and -1.2U_{equ} (other H atoms). The rotating model group was

considered for the methyl group. In the case of N1, the hydrogen atom was located from a difference Fourier map and refined isotropically.

Data collection

Oxford Diffraction Xcalibur Sapphire2 (large Be window) diffractometer	2746 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.018$
graphite	$\theta_{max} = 26.5°$, $\theta_{min} = 3.0°$
ω scans	$h = -6\rightarrow6$
10305 measured reflections	$k = -8\rightarrow10$
3149 independent reflections	$l = -22\rightarrow22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.094$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0535P)^2 + 0.1328P]$ where $P = (F_o^2 + 2F_c^2)/3$
3149 reflections	$(\Delta/\sigma)_{max} = 0.001$
169 parameters	$\Delta\rho_{max} = 0.33$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.15$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.002 Å; R factor = 0.034; wR factor = 0.097; data-to-parameter ratio = 11.6.

In the title compound, $C_{10}H_8N_2O_5$, the molecule is slightly distorted from planarity. The molecular structure is stabilized by two intramolecular hydrogen bonds. The first is a short O—H···O hydrogen bond (H···O distance = 1.57 Å) within the maleamic acid unit and the second is a C—H···O hydrogen bond (H···O distance = 2.24 Å) which connects the amide group with the benzene ring. The nitro group is twisted by 6.2 (2)° out of the plane of the benzene ring. The crystal structure manifests a variety of hydrogen bonding. The packing is dominated by a strong intermolecular N—H···O interaction which links the molecules into chains running along the *b* axis. The chains within a plane are further assembled by three additional types of intermolecular C—H···O hydrogen bonds to form a sheet parallel to the ($\bar{1}$01) plane.

N-(3-Nitrophenyl)maleamic acid

B. T. Gowda, M. Tokarcík, K. Shakuntala, J. Kozísek and H. Fuess

Comment

In the present study, as a part of studying the effect of ring and side chain substitutions on the crystal structures of biologically significant amides (Gowda *et al.*, 2010*a,b,c*; Prasad *et al.*, 2002), the crystal structure of *N*-(3-nitrophenyl)maleamic acid (I) has been determined (Fig. 1). The conformation of the N—H in the amide segment is *anti* to the C=O bond and is also *anti* to the *meta*-nitro group in the phenyl ring.

In the maleamic acid moiety, the amide C=O bond is *anti* to the adjacent C—H bond, while the carboxyl C=O bond is *syn* to the adjacent C—H bond. The observed rare *anti* conformation of the C=O and O—H bonds of the acid group is similar to that obsrved in *N*-(2-methylphenyl)-maleamic acid (Gowda *et al.*, 2010*b*), *N*-(3-chlorophenyl)-maleamic acid (Gowda *et al.*, 2010*c*) and *N*-(3,5-dichlorophenyl)- maleamic acid (Gowda *et al.*, 2010*a*).

The molecule in (I) is slightly distorted from planarity as indicated by the dihedral angle of 4.5 (1)° between the least squares planes of the maleamic acid unit (r.m.s. deviation of 0.050 Å) and the phenyl ring. The molecular structure (Fig. 1) is stabilized by two intramolecular hydrogen bonds (Table 1). The first is a short O–H···O hydrogen bond ((H···O distance of 1.57 Å) within the maleamic acid unit; the second one is a C–H···O hydrogen bond (H···O distance of 2.24 Å) which connects the amide group with the phenyl ring. The nitro group - known to be a strong electron- withdrawing substituent - opens up the *ipso* C–C–C angle and narrows the two adjacent intracyclic angles. This fact is evident from the intracyclic bond angles C6–C7–C8, C5–C6–C7 and C7–C8–C9 of 123.99 (12)°, 117.49 (12)° and 117.64 (12)° respectively. The nitro group is twisted 6.2 (2)° out of the plane of the phenyl ring.

The crystal structure (Fig. 2) manifests a variety of hydrogen bonding. The packing is dominated by a strong intermolecular N–H···O interaction (H···O distance of 2.05 Å) which links the molecules into the chains running along the *b* axis. The chains within a plane are further assembled by additional three types of intermolecular C–H···O hydrogen bonds to form a sheet parallel to the (-1 0 1) plane (Bernstein *et al.*, 1995).

Experimental

The solution of maleic anhydride (0.025 mol) in toluene (25 ml) was treated dropwise with the solution of 3-nitroaniline (0.025 mol) also in toluene (20 ml) with constant stirring. The resulting mixture was warmed with stirring for over 30 min and set aside for an additional 30 min at room temperature for completion of the reaction. The mixture was then treated with dilute hydrochloric acid to remove the unreacted 3-nitroaniline. The resultant solid *N*-(3-nitrophenyl)maleamic acid was filtered under suction and washed thoroughly with water to remove the unreacted maleic anhydride and maleic acid. It was recrystallized to constant melting point from ethanol. The purity of the compound was checked by elemental analysis and characterized by its infrared spectra.

Prism like light brown single crystals used in X-ray diffraction studies were grown in an ethanol solution by slow evaporation at room temperature.

Refinement

All H atoms were visible in difference maps. The positions of carboxyl and amide H atoms were tested in preliminary refinement using a soft restraints on the O–H and N–H distances. Finally, all H atoms were positioned with idealized geometry using a riding model with the distances C–H = 0.93 Å, N–H = 0.86 Å and O–H = 0.93 Å. The U_{iso}(H) values were set at $1.2U_{eq}$(C aromatic, N) and $1.5U_{eq}$(O).

Figures

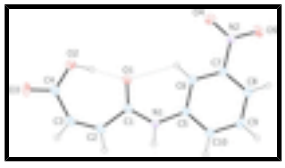

Fig. 1. Molecular structure of (I) showing the atom labelling scheme. Displacement ellipsoids are drawn at the 30% probability level. Two short intramolecular bonds are indicated by dashed lines. H atoms are represented as small spheres of arbitrary radii.

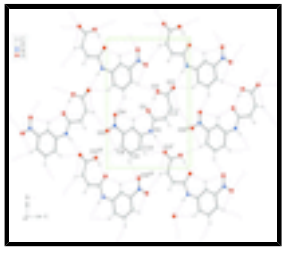

Fig. 2. Part of crystal structure of (I) viewed down the *a* axis and showing a two-dimensional network of molecules linked by several types of intermolecular N–H···O and C–H···O hydrogen bonds (dashed lines). Symmetry codes (i): -*x* + 1, *y* - 1/2, -*z* + 3/2; (ii): *x* + 1, *y*, *z* + 1; (iii): -*x*, *y* - 1/2, -*z* + 1/2.

N-(3-Nitrophenyl)maleamic acid

Crystal data

$C_{10}H_8N_2O_5$	$F(000)$ = 488
M_r = 236.18	D_x = 1.561 Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, λ = 0.71073 Å
Hall symbol: -P 2ybc	Cell parameters from 10218 reflections
a = 7.9965 (2) Å	θ = 2.3–29.4°
b = 14.0253 (3) Å	μ = 0.13 mm^{-1}
c = 9.1026 (2) Å	*T* = 295 K
β = 100.147 (3)°	Prism, light brown
V = 1004.92 (4) Å^3	0.57 × 0.33 × 0.28 mm
Z = 4	

Data collection

Oxford Diffraction Gemini R CCD diffractometer	1793 independent reflections
graphite	1544 reflections with $I > 2\sigma(I)$
Detector resolution: 10.434 pixels mm^{-1}	R_{int} = 0.023
ω scans	θ_{max} = 25.1°, θ_{min} = 2.6°
Absorption correction: analytical (*CrysAlis PRO*; Oxford Diffraction, 2009)	*h* = −9→9

T_{min} = 0.926, T_{max} = 0.971	k = −16→16
17136 measured reflections	l = −10→10

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.034	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.097	H-atom parameters constrained
S = 1.08	$w = 1/[\sigma^2(F_o^2) + (0.0618P)^2 + 0.1002P]$ where $P = (F_o^2 + 2F_c^2)/3$
1793 reflections	$(\Delta/\sigma)_{max} < 0.001$
154 parameters	$\Delta\rho_{max}$ = 0.15 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.19 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.105; data-to-parameter ratio = 17.1.

In the title compound, $C_{17}H_{15}FO_3S$, the 4-fluorophenyl ring makes a dihedral angle of 72.67 (5)° with the benzofuran plane. In the crystal, molecules are linked by weak intermolecular C—H···O hydrogen bonds.

3-(4-Fluorophenylsulfonyl)-2,5,7-trimethyl-1-benzofuran

H. D. Choi, P. J. Seo, B. W. Son and U. Lee

Comment

Compounds containing a benzofuran moiety show potent pharmacological properties such as antifungal (Aslam *et al.*., 2006), antitumor and antiviral (Galal *et al.*., 2009), antimicrobial (Khan *et al.*., 2005) activities. These compounds widely occur in nature (Akgul & Anil, 2003; Soekamto *et al.*. 2003). As a part of our ongoing studies of the effect of side chain substituents on the solid state structures of 2,5-dimethyl-3-phenylsulfonyl-1-benzofuran analogues (Choi *et al.*., 2008*a, b*), we report the crystal structure of the title compound (Fig. 1).

The benzofuran unit is essentially planar, with a mean deviation of 0.009 (1) Å from the least-squares plane defined by the nine constituent atoms. The 4-fluorophenyl ring makes a dihedral angle of 72.67 (5)° with the benzofuran plane. The crystal packing (Fig. 2) is stabilized by three intermolecular C—H···O hydrogen bonds; the first one between the methyl H atom and the oxygen of the O═S═O unit, with a C10—H10B···O2^{i}, the second one between the 4-fluorophenyl H atom and the oxygen of the O═S═O unit, with a C13—H13···O2^{ii}, and the third one between the 4-fluorophenyl H atom and the oxygen of the O═S═O unit, with a C17—H17···O3^{iii}, respectively (Table 1).

Experimental

77% 3-Chloroperoxybenzoic acid (538 mg, 2.4 mmol) was added in small portions to a stirred solution of 3-(4-fluorophenyl-sulfanyl)-2,5,7-trimethy-1-benzofuran (343 mg, 1.2 mmol) in dichloromethane (50 mL) at 273 K. After being stirred at room temperature for 8h, the mixture was washed with saturated sodium bicarbonate solution and the organic layer was separated, dried over magnesium sulfate, filtered and concentrated at reduced pressure. The residue was purified by column chromatography (silica gel, hexane-ethyl acetate, 2:1 v/v) to afford the title compound as a colorless solid [yield 79%, m.p. 414-415 K; R_f = 0.41 (benzene)]. Single crystals suitable for X-ray diffraction were prepared by slow evaporation of a solution of the title compound in diisopropyl ether at room temperature.

Refinement

All H atoms were positioned geometrically and refined using a riding model, with C—H = 0.95 Å for aryl and 0.98 Å for methyl H atoms, U_{iso}(H) = 1.2 U_{eq}(C) for aryl and 1.5U_{eq}(C) for methyl H atoms.

Figures

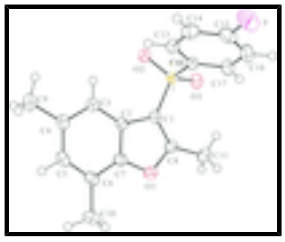

Fig. 1. The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are presented as a small spheres of arbitrary radius.

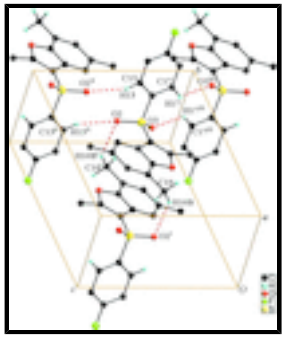

Fig. 2. C—H···O interactions (dotted lines) in the crystal structure of the title compound. [Symmetry codes: (i) - x + 1, - y + 1, - z + 1; (ii) - x + 1, - y + 2, - z + 1; (iii) - x + 1, - y + 2, - z.]

3-(4-Fluorophenylsulfonyl)-2,5,7-trimethyl-1-benzofuran

Crystal data

$C_{17}H_{15}FO_3S$	Z = 2
M_r = 318.35	F(000) = 332
Triclinic, $P\overline{1}$	D_x = 1.413 Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, λ = 0.71069 Å
a = 8.2851 (2) Å	Cell parameters from 7810 reflections
b = 9.3762 (2) Å	θ = 2.4–27.5°
c = 11.2241 (3) Å	μ = 0.24 mm^{-1}
α = 70.441 (1)°	T = 173 K
β = 71.177 (1)°	Block, colourless
γ = 69.407 (1)°	0.23 × 0.21 × 0.19 mm
V = 748.07 (3) Å^3	

Data collection

Bruker SMART APEXII CCD diffractometer	3449 independent reflections
Radiation source: rotating anode	3097 reflections with $I > 2\sigma(I)$
graphite multilayer	R_{int} = 0.026
Detector resolution: 10.0 pixels mm^{-1}	θ_{max} = 27.6°, θ_{min} = 2.0°
φ and ω scans	h = −10→10
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	k = −12→12
T_{min} = 0.948, T_{max} = 0.957	l = −14→14
13476 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: difference Fourier map
$wR(F^2) = 0.105$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0536P)^2 + 0.3586P]$ where $P = (F_o^2 + 2F_c^2)/3$
3449 reflections	$(\Delta/\sigma)_{max} < 0.001$
202 parameters	$\Delta\rho_{max} = 0.28$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2$sigma(F^2) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 2 December 2009; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.031; wR factor = 0.086; data-to-parameter ratio = 14.8.

The asymmetric unit of the title complex, $[Zn(H_2O)_6](C_{10}H_5O_8)_2\cdot 2C_{11}H_6N_2O\cdot 2H_2O$, contains one half of the complex cation with the Zn^{II} ion located on an inversion center, a monovalent 2,4,5-tricarboxybenzoate (1,2,4,5-BTC) counter-anion, a 4,5-diazafluoren-9-one (DAFO) molecule and an uncoordinated water molecule. In the crystal structure, O—H···O and O—H···N hydrogen bonds link the cations, anions and water molecules into a three-dimensional network.

Hexaaquazinc(II) bis(2,4,5-tricarboxybenzoate) 4,5-diazafluoren-9-one disolvate dihydrate

G.-F. Yang and Y.-H. Zhao

Comment

Single-crystal X-ray diffraction analyses revealed Zn^{II} is hexa-coordinated and exhibits octahedral coordintion environment supplied by six water molecules (Fig. 1). The O atoms from four coordinated water molecules in the equatorial plane around the Zn^{II} ion form a slightly distorted square-planar arrangement with an average Zn—O bond length of 2.073 (1) Å; the slightly distorted octahedral coordination is completed by the other O atoms at a slightly shorter distance [2.055 (2) Å] in the axial positions. benzene-1,2,4,5-tetracarboxylate (1,2,4,5-BTC) counter-anion, and DAFO molecule are both uncoordinated. Intermolecular hydrogen bonds, O—H···O and O—H···N, extend the ion complex into a three-dimensional supramolecular network structure (Fig. 2, Table 1).

Experimental

Zinc(II) acetate dihydrate (0.066 g, 0.3 mol), benzene-1,2,4,5-tetracarboxylate (0.055 g, 0.2 mmol), 4, 5-diazafluoren-9-one (0.036 g, 0.2 mmol), sodium hydroxide (0.016 g, 0.4 mmol) and water (14 ml) were placed in a 23 ml Teflon-lined autoclave, and the autoclave was heated at 423 K for 3 d. After cooling slowly to room temperature at a rate of 10 K h^{-1}, colorless crystals were obtained.

Refinement

C-bound H atoms were treated as riding, with C—H = 0.93Å and U_{iso}(H) = 1.2 times U_{eq}(C). O-bound H atoms were located in a difference Fourier map and refined as riding in their as-found relative positions; U_{iso}(H) = 1.5U_{eq}(O).

Figures

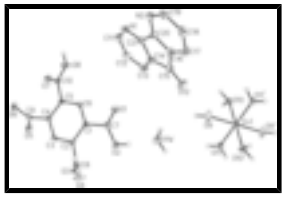

Fig. 1. View of the local coordination of Zn^{II} with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

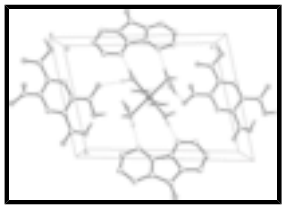

Fig. 2. A packing diagram for the three-dimensional supramolecular framework *via* O—H···O interactions. The view direction is parallel to the *a* axis. Hydrogen bonds are indicated by dashed lines.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.031$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.086$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0461P)^2 + 0.2811P]$ where $P = (F_o^2 + 2F_c^2)/3$
5060 reflections	$(\Delta/\sigma)_{max} = 0.001$
343 parameters	$\Delta\rho_{max} = 0.28$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.34$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.004 Å; R factor = 0.035; wR factor = 0.092; data-to-parameter ratio = 17.4.

In the title compound, $\{[Zn(C_8H_7O_2)_2(C_{10}H_8N_2S_2)_2]\cdot H_2O\}_n$, the Zn^{II} atom is coordinated by four N atoms from four 4,4′-(disulfanediyl)dipyridine (bpds) ligands and two O atoms from two 2-phenylacetate anions in a distorted octahedral coordination geometry. The two bpds ligands of the same axial chirality bridge Zn^{II} atoms, generating repeated rhomboidal chains, which are linked by O—H···O hydrogen bonds into a ladder structure.

catena-Poly[[[(2-phenylacetato-κO)zinc(II)]bis[μ-4,4'-(disulfanediyl)dipyridine-$\kappa^2 N$:N']] monohydrate\]

J. Zhang and W. Xu

Comment

Recently, a variety of pyridyl-donor ligands have been widely employ to construct coordination polymers with intriguing topologies and unexpected properties (Biradha *et al.*, 2006; Liu *et al.*, 2008; Hernández-Ahuactzi *et al.*, 2008; Ma, Wang, Hu *et al.*, 2009). 4,4'-dipyridyl disulfide (bpds) is a bipyridyl-type ligand with a twisted structuret. Addtionally, bpds ligand has axial chirality. A number of coordination polymers containing bpds ligand have been reported (Horikoshi *et al.*, 2006; Carballo *et al.*, 2008; Ma, Wang, Wang *et al.*, 2009). Phenylacetic acid is one of the most common carboxylate ligands and can adopt different coordination modes (Johnston *et al.*, 2008). However, the coordination polymers based on mixed bpds and phenylacetate anion have not been reported to date. In this paper, we report the title Znic polymeric compound, $[\{Zn(bpds)_2(C_6H_5CH_2COO)_2\}.H_2O]_n$ with a 1D repeated rhomboidal chain structure. The unsymmetrical unit of the title compound consisits of one Zn^{2+} cation, two bpds molecules of the same chirality, two phenylacetate anions and one lattice water molecule (Fig.1).The *M*- and *P*- bpds molecules act as bis-monodentate bridging ligands with the C—S—S—C torsion angle being 97.10 (1)° and 93.40 (1)°, respectively, and the corresponding py ring planes form dihedral angles of 89.06 (6)° and 79.42 (6)°. Both crystallographically distinct phenylacetate anions monodentately coordinate to the metal atoms.The Zn atom has a distorted octahedral environment, being surrounded by two nitrogen atoms from two *M*-bpds and two nitrogen atoms from two *P*-bpds in the equatorial plane, and by two oxygen atoms from two crystallographically distinct phenylacetate anions occupying the axial positions. The corresponding bond distances range from 2.111 (2)Å to 2.202 (2) Å, and the bond angles in the region 84.12 (7)—175.94 (7)° deviate from the values of 90° and 180° for an ideal octahedron (table 1). Along the [110] direction, the two bpds ligands of the same chirality bridge Zn atoms to form 1D repeated rhomboidal chains(Fig. 2), which is similar with the structures of the reported zinc coordination polymers based on bpds ligand (Horikoshi *et al.*, 2005). The Zn···Zn separation through bpds ligands is 11.187 Å. The lattice water form hydrogen bonds to the uncoordinated carboxylate oxygen atoms of two different phenylacetate anions. In this way, the adjacent chains are linked by water molecules to give a ladder structure.

Experimental

0.0750 g (0.25 mmol) $Zn(NO_3)_2.6H_2O$ and 0.0345 g (0.25 mmol) phenylacetic acid were succesively dissolved in a stirred aqueous ethanolic solution consisting of 5 ml EtOH and 10 ml H_2O, to which 0.5 ml 1.0 M NaOH was added. The formed white suspension was stirred at 80°C for 30 min and then added was an ethanolic solution of 0.0570 g (0.25 mmol) 4,4'-dipyridyldisulfide in 5 ml EtOH. The final mixture was further stirred at 75°C for 1 h and filtered off. The colorless filtrate (pH=6.02) was left standing at room temperature for one week affording colorless block-like crystals (yield: 4 mg).

Refinement

H atoms bonded to C atoms were palced in geometrically calculated position and were refined using a riding model, with U_{iso}(H) = 1.2 Ueq(C). H atoms attached to O atoms were found in a difference Fourier synthesis and were refined using a riding model, with the O—H distances fixed as initially found and with U_{iso}(H) values set at 1.2 *U*eq(O).

Data collection

Rigaku R-AXIS RAPID diffractometer	7859 independent reflections
Radiation source: fine-focus sealed tube	6036 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.038$
Detector resolution: 0 pixels mm^{-1}	$\theta_{max} = 27.5°$, $\theta_{min} = 3.1°$
ω scans	$h = -12 \rightarrow 12$
Absorption correction: multi-scan (*ABSCOR*; Higashi, 1995)	$k = -11 \rightarrow 14$
$T_{min} = 0.623$, $T_{max} = 0.701$	$l = -23 \rightarrow 23$
16701 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.035$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.092$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0395P)^2 + 0.3693P]$ where $P = (F_o^2 + 2F_c^2)/3$
7859 reflections	$(\Delta/\sigma)_{max} = 0.001$
451 parameters	$\Delta\rho_{max} = 0.43$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.34$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 185 K; mean σ(C–C) = 0.007 Å; R factor = 0.051; wR factor = 0.107; data-to-parameter ratio = 18.3.

The title compound, $[ZnCl_2(C_{10}H_{14}N_4)]_n$, is a coordination polymer consisting of zigzag chains propagating in [001], in which the metal cation exhibits a distorted tetrahedral $ZnCl_2N_2$ coordination. Adjacent chains are linked by intermolecular C—H···Cl hydrogen bonds, forming a three-dimensional supramolecular network.

catena-Poly[[dichloridozinc(II)]-μ-1,1'-(butane-1,4-diyl)diimidazole-$\kappa^2N^3:N^{3'}$]

R.-L. He, F.-J. Meng, G.-H. Wang, W. Yang and J.-W. Xu

Comment

N-heterocyclic compounds have been extensively studied in coordination chemistry research for their excellent bridging ability (Hu *et al.*, 2003; Ohmori *et al.*, 2005; Chen *et al.*, 2004; Hu *et al.*, 2005). The compound 1,1'-(1,4-butanediyl)bis(imidazole) (bbi), as a flexible nitrogenous ligand with a long -$CH_2CH_2CH_2CH_2$- spacer, can link discrete clusters into an extended network and is a good candidate to form highly connected 3D frameworks. A number of metal-bbi coordination polymers have been reported (Li *et al.*, 2006; Liu *et al.*, 2007; Jin *et al.*, 2007; Yang *et al.*, 2009; Qi *et al.*, 2008). Here we present a new polymeric compound, $[ZnCl_2(bbi)]_n$, (I), with a zigzag chain structure, synthesized under solvothermal conditions.

In the title compound, (I), the Zn centers are four-coordinated by two N atoms from two bbi ligands [Zn(1)—N(1) = 2.005 (3) Å and Zn(1)—N(3) = 2.013 (3) Å] and two Cl atoms [Zn(1)—Cl(1) = 2.2557 (11) Å and Zn(1)—Cl(2) =2.2321 (12) Å], resulting in a distorted tetrahedral geometry (Fig. 1). Each bbi coordinates to two Zn atoms through its two aromatic N atoms and acts as a bridging bidentate ligand to form a one-dimensional zigzag chain (Fig. 2). The adjacent Zn···Zn distance is 14.290 Å, which is similar to that observed in $[Cu_2(bbi)_2Cl_2]$ (Qi *et al.*, 2008). In addition, these one-dimensional chains are further connected by weak intermolecular C—H···Cl hydrogen bonds to construct a three-dimensional supramolecular network (Fig. 2).

Experimental

The title compound was solvothermally prepared from a reaction mixture of $ZnCl_2$ (0.3 mmol), bbi (0.1 mmol), ethanol (3 ml) and distilled water (7 ml); the pH value was adjusted to 4.5 with triethylamine and acetic acid. The mixture was stirred for 20 min at room temperature, then sealed in a 20 ml teflon-lined stainless steel autoclave and heated at 433 K for 72 h under autogenous pressure. After cooling to room temperature, colorless block crystals were obtained (yield 83% based on Zn).

Refinement

H atoms were positioned geometrically and refined with fixed individual displacement parameters [$U_{iso}(H) = 1.2U_{eq}(C)$], using a riding model, with C—H distances of 0.93 Å for Csp^2 and 0.97 Å for CH_2.

Figures

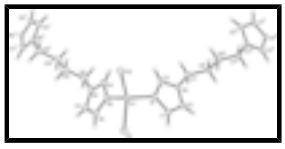

Fig. 1. Partial molecular structure of the title compound showing the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. Atoms marked with i or ii are at the symmetry positions (x+2, y+5/2, 3/2-z) and (x, y+5/2, 1/2-z) respectively.

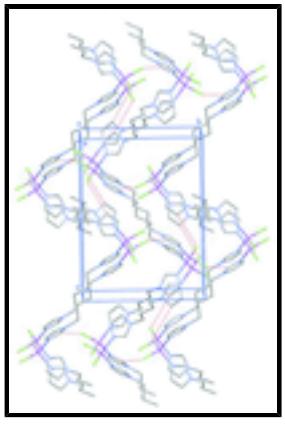

Fig. 2. The zigzag polymeric chain structure of the title compound. Dashed lines denote hydrogen bonds.

catena-Poly[[dichloridozinc(II)]-μ-1,1'-(butane-1,4-diyl)diimidazole- $\kappa^2N^3:N^{3'}$]

Crystal data

$[ZnCl_2(C_{10}H_{14}N_4)]$	$F(000) = 664$
$M_r = 326.52$	$D_x = 1.517$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 2763 reflections
$a = 7.8090$ (9) Å	$\theta = 2.2$–$26.1°$
$b = 11.6001$ (13) Å	$\mu = 2.08$ mm^{-1}
$c = 15.8047$ (18) Å	$T = 185$ K
$\beta = 92.908$ (2)°	Block, colorless
$V = 1429.8$ (3) Å^3	0.29 × 0.22 × 0.15 mm
$Z = 4$	

Data collection

Bruker SMART APEX CCD diffractometer	2820 independent reflections
Radiation source: fine-focus sealed tube	2174 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.054$
φ and ω scans	$\theta_{max} = 26.1°$, $\theta_{min} = 2.2°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -9 \rightarrow 9$
$T_{min} = 0.585$, $T_{max} = 0.742$	$k = -11 \rightarrow 14$
7827 measured reflections	$l = -19 \rightarrow 19$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.107$	H-atom parameters constrained

S = 1.06	$w = 1/[\sigma^2(F_o^2) + (0.0437P)^2 + 0.2952P]$ where $P = (F_o^2 + 2F_c^2)/3$
2820 reflections	$(\Delta/\sigma)_{max} < 0.001$
154 parameters	$\Delta\rho_{max} = 0.68$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.36$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 10 May 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 120 K; mean σ(C–C) = 0.010 Å; disorder in main residue; R factor = 0.044; wR factor = 0.115; data-to-parameter ratio = 18.2.

In the mononuclear title compound, $[MoCl_3(C_4H_8O)(C_{14}H_{15}P)_2]$, obtained by the reaction of trichlorotris(tetrahydrofuran)molybdenum(III) and ethyldiphenylphosphine in tetrahydrofuran (THF) solution, the Mo^{III} atom is six-coordinated by one O atom of a THF molecule, two P atoms from two ethyldiphenylphosphine ligands and three Cl atoms in a distorted octahedral geometry. The C atoms of the THF molecule are disordered over two positions in a 0.55 (2): 0.45 (2) ratio.

Trichloridobis(ethyldiphenylphosphine)(tetrahydrofuran)molybdenum(III)

T. Kruczynski, J. Pikies and L. Ponikiewski

Comment

The title molecule [$MoCl_3(PEtPh_2)(THF)$] was prepared as a potential adduct for synthesis with lithium phosphanides of the formula R_2P—$P(SiMe_3)Li$ (R = ^{t}Bu, ^{i}Pr, Et_2N, $^i Pr_2N$).

The Mo^{III} atom resides in a distorted $MoCl_3OP_2$ octahedral environment. The equatorial positions are occupied by three Cl atoms and one O atom from the THF, while the axial positions are occupied by P atoms from two ethyldiphenylphosphine residues. The Mo—Cl bond length [2.3871 (13) Å, 2.3822 (13) Å, 2.4126 (13) Å], the Mo—P bond length [2.5964 (14) Å, 2.5974 (13) Å] and the Mo—O bond length [2.206 (3) Å] are very similar to the previously reported molybdenum complexes (Cotton & Vidyasagar, 1995; Cotton & Jianrui, 1996; Hofacker *et al.*, 1989; Borgmann *et al.*, 1997).

Atoms C29, C30, C31, C32 from the THF molecule were disordered over two positions. During the refinement process the disorder models were refined with occupancies of 0.55 (2) and 0.45 (2).

Experimental

The title compound was prepared according to the previously published method (Anker *et al.*, 1975)

Refinement

Atoms C29, C30, C31, C32 were disordered over two positions. During the refinement process the disorder models were refined with occupancies of 0.55 (2) and 0.45 (2). H atoms bonded to C were included in calculated positions and refined as riding on their parent C atom with C—H = 0.95 Å, U_{iso}(H) = 1.2 U_{eq}(C) for aromatic; C—H = 0.99 Å, U_{iso}(H) = 1.2 U_{eq}(C) for methylene; and C—H = 0.98 Å, U_{iso}(H) = 1.5 U_{eq}(C) for methyl atoms.

Figures

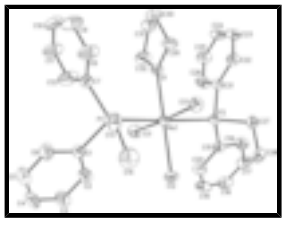

Fig. 1. The molecular structure of the title compound showing the atomic numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. For clarity, all H atoms and the minor component of the disorder have been omitted.

Trichloridobis(ethyldiphenylphosphine)(tetrahydrofuran)molybdenum(III)

Crystal data

$[MoCl_3(C_4H_8O)(C_{14}H_{15}P)_2]$	$F(000) = 1444$
$M_r = 702.85$	$D_x = 1.438$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 5220 reflections
$a = 15.437$ Å	$\theta = 2.0$–$28.9°$
$b = 13.356$ Å	$\mu = 0.77$ mm^{-1}
$c = 20.229$ Å	$T = 120$ K
$\beta = 128.87°$	Block, orange
$V = 3247.1$ Å^3	0.13 × 0.1 × 0.04 mm
$Z = 4$	

Data collection

Oxford Diffraction KM-4/Xcalibur diffractometer with a Sapphire2 (large Be window) detector	7022 independent reflections
graphite	2985 reflections with $I > 2\sigma(I)$
Detector resolution: 8.1883 pixels mm^{-1}	$R_{int} = 0.089$
ω scans	$\theta_{max} = 27°$, $\theta_{min} = 2°$
Absorption correction: analytical [*CrysAlis RED* (Oxford Diffraction, 2006). based on expressions derived by Clark & Reid (1995)]	$h = -15 \rightarrow 19$
$T_{min} = 0.937$, $T_{max} = 0.97$	$k = -16 \rightarrow 17$
25240 measured reflections	$l = -25 \rightarrow 22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.044$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.115$	H-atom parameters constrained
$S = 0.81$	$w = 1/[\sigma^2(F_o^2) + (0.0551P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
7022 reflections	$(\Delta/\sigma)_{max} = 0.001$
385 parameters	$\Delta\rho_{max} = 0.70$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.54$ e Å^{-3}

Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2006) Analytical numeric absorption correction using a multifaceted crystal model based on expressions derived by Clark & Reid (1995)

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

Received 17 May 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.008 Å; disorder in solvent or counterion; R factor = 0.051; wR factor = 0.159; data-to-parameter ratio = 12.0.

In the title compound, $[Cu(CH_3CO_2)(C_{12}H_8N_2)_2](CF_3CO_2)\cdot 4H_2O$, the Cu^{II} atom shows a distorted octahedral coordination with four N atoms [Cu—N = 2.015 (3)–2.244 (3) Å] from the two phenanthroline ligands and two O atoms from the acetate [Cu—O = 1.953 (3) and 2.764 (3) Å]. Strong intermolecular O—H···O hydrogen-bonding interactions consolidate the crystal packing. The F atoms of the anion are disordered over two positions in a 0.5233 (3):0.4767 (3) ratio.

(Acetato-κ^2O,O')bis(1,10-phenanthroline-κ^2N,N')copper(II) trifluoroacetate tetrahydrate

J. Wang and Z. Jin

Comment

Metal complexes with carboxylates are among the most investigated complexes in the field of coordination chemistry, in which metal-1,10-phenanthroline complexes and their derivatives have also attracted much attention during recent decades because of their interesting features (Sun *et al.*, 2007; Liu *et al.*, 2009). In this work, the title compound was obtained by the reaction of trifluoroacetic acid and cupric acetate in the presence of 1,10-phenanthroline as co-ligand.

The molecular structure of the title complex is shown in Fig. 1. The Cu^{II} atom exhibits a six-coordinate distorted octahedral geometry with four N atoms [Cu—N 2.015 (3) Å–2.244 (3) Å] from two phenanthroline ligands and two O atoms from the acetate ligand [Cu—O 1.953 (3), 2.764 (3) Å]. Three N atoms and one O atom occupy the equatorial positions with a slight departure from the ideal plane by 0.0563 (2) Å, while one O atom and one N atom lie in the apical positions with an axis angle of 140.63 (10)°, showing a large deviation from the expected 180°. Strong intermolecular O—H···O hydrogen bonding interactions exist.

Experimental

The reaction was carried out by the solvothermal method. Trifluoroacetic acid (0.114 g,1 mmol) and cupric acetate (0.199 g, 1 mmol) and 1,10-phenanthroline (0.312 g, 2 mmol) were added to an airtight vessel with the 21 ml of a 2:1 ethanol-water mixture. The resulting blue solution was filtered. Upon standing, the filtrate yielded blue block-shaped crystals after several days.

The yield is 76% and elemental analysis: calc. for $C_{28}H_{27}CuF_3N_4O_8$: C 50.34, H 4.07, N 8.39; found: C 50.52, H 4.29, N 8.53. The elemental analyses were performed with PERKIN ELMER MODEL 2400 SERIES II.

Refinement

The U_{iso}(H) values were set at 1.2U_{eq}(C—H) for the H atoms from the phen rings and waters, 1.5U_{eq}(C—H) for the methyl moiety. As the diffraction intensities were of high quality, the H atoms could be located in difference Fourier maps and refined using the riding model. Three disordered F atoms were treated as statistically disordered between two positions with the refined occupancies of 0.5233 (3) and 0.4767 (3), respectively.

Figures

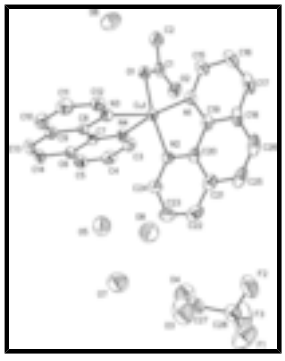

Fig. 1. The molecular structure of title compound, with atom labels and 30% probability displacement ellipsoids for non-H atoms.

Data collection

Bruker SMART APEX diffractometer	5112 independent reflections
Radiation source: fine-focus sealed tube	4389 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.043$
phi and ω scans	$\theta_{max} = 25.1°$, $\theta_{min} = 2.5°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$h = -10 \rightarrow 10$
$T_{min} = 0.801$, $T_{max} = 0.859$	$k = -13 \rightarrow 13$
7689 measured reflections	$l = -18 \rightarrow 17$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.159$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.108P)^2 + 0.7243P]$ where $P = (F_o^2 + 2F_c^2)/3$
5112 reflections	$(\Delta/\sigma)_{max} = 0.002$
425 parameters	$\Delta\rho_{max} = 1.04$ e Å^{-3}
103 restraints	$\Delta\rho_{min} = -0.86$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 24 May 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 193 K; mean σ(C–C) = 0.004 Å; R factor = 0.031; wR factor = 0.081; data-to-parameter ratio = 14.4.

The asymmetric unit of the title compound, $C_{18}H_{11}Br_2ClO_3$, contains two crystallographically independent molecules in which the dihedral angles between the naphthalene ring systems and the benzene rings are 55.64 (11) and 60.50 (11)°. In each molecule, an intramolecular O—H···O=C hydrogen bond generates a six-membered ring. In the crystal structure, intermolecular C—H···O and C—H···Cl hydrogen bonds and two different Br···O halogen bonds [2.9850 (19) and 3.2169 (19) Å] are observed.

Related literature

(4-Chlorophenyl)(3,6-dibromo-2-hydroxy-7-methoxy-1-naphthyl)methanone

R. Mitsui, A. Nagasawa, S. Watanabe, A. Okamoto and N. Yonezawa

Comment

Recently, we reported the crystal structures of 1-aroylated 2,7-dimethoxynaphthalenes, 1-(4-chlorobenzoyl)-2,7-dimethoxynaphthalene (Mitsui *et al.*, 2008*a*), (4-chlorophenyl)(2-hydroxy-7-methoxynaphthalen-1-yl)methanone (Mitsui *et al.*, 2008*b*), (4-chlorophenyl)(2-ethoxy-7-methoxynaphthalen-1-yl)methanone (Mitsui *et al.*, 2009), 1-bromo-8-(4-chlorobenzoyl)-7-hydroxy-2-methoxynaphthalene (Mitsui *et al.*, 2010*a*), (8-bromo-2,7-dimethoxy-1-naphthyl)(4-chlorophenyl)methanone (Mitsui *et al.*, 2010*b*) and (4-chlorophenyl)(3,8-dibromo-2-hydroxy-7-methoxy-1-naphthyl)methanone (Mitsui *et al.*, 2010*c*). As a part of our ongoing studies on the synthesis and crystal structure analysis of aroylated naphthalene derivatives, we prepared and analysed the structure of a single crystal of 2,7-dibromo-4-(4-chlorobenzoyl)-3-hydroxy-6-methoxynaphthalene, (I). The title compound was prepared by electrophilic aromatic bromination reaction of (4-chlorophenyl)(2-hydroxy-7-methoxynaphthalen-1-yl)methanone with bromine.

An *ORTEPIII* (Burnett & Johnson, 1996) plot of (I) is shown in Fig. 1. The title compound crystallizes in the monoclinic crystal system such that there are two molecules in the asymmetric unit, molecules *A* and *B*, respectively. In *A*, the dihedral angle between the naphthalene ring (C1–C10) and the benzene ring (C12–C17) is 55.64 (11)°, and the central carbonyl C—(C═O)—C group is relatively coplanar to the naphthalene ring [9.72 (15)°]. In *B*, by contrast, the dihedral angle between the naphthalene ring (C19–C28) and the benzene ring (C30–C35) is 60.50 (11)°, and the central carbonyl C—(C═O)—C group is twisted away from the naphthalene ring [23.73 (15)°]. In each molecule, the hydroxy groups are involved in O—H···O═C hydrogen bond generates a six-membered ring (Fig. 1 and Table 1).

In the crystal structure, intermolecular C—H···O and C—H···Cl hydrogen bonding interactions contribute to the stabilization of the molecular and crystal structures (Figs. 2 and 3, Table 1). Additionally, the contact distances Br2···O1 and Br3···O6 are 2.9850 (19) and 3.2169 (19) Å, respectively (Figs. 2 and 3). These contacts are shorter than the sum of their van der Waals radii (3.37 Å), and arranged nearly linearly [C7—Br2···O1 = 172.24 (10)°, C21—Br3···O6 = 142.02 (9)°], suggesting that there is a possibility for halogen bonding, which further contributes to crystal packing stability (Politzer *et al.*, 2007).

Experimental

To a solution of (4-chlorophenyl)(2-hydroxy-7-methoxynaphthalen-1-yl)methanone (313 mg, 1.00 mmol) in chloroform (5 ml) was added Br_2 (646 mg, 4.04 mmol) drop-wise at 0 °C. The reaction mixture was stirred for 12 h at 0 °C, then poured into aqueous 2 *M* $Na_2S_2O_3$ (10 ml), and the aqueous layer was extracted with $CHCl_3$ (3 × 10 ml). The combined organic layers were washed with 2 *M* $Na_2S_2O_3$ (3 × 30 ml) and brine (3 × 30 ml), and dried over $MgSO_4$ overnight. The solvent was removed *in vacuo* and the crude material was purified by column chromatography (silica gel, $CHCl_3$) to give the title compound (yield 409 mg, 87%). Single crystals suitable for X-ray diffraction analysis were obtained from $CHCl_3$ as yellow blocks (m.p. 431.5–432.0 K).

Spectroscopic Data: ^{1}H NMR (300 MHz, $CDCl_3$) δ 10.10 (s, 1H), 8.04 (s, 1H), 7.88 (s, 1H), 7.63 (d, 2H), 7.43 (d, 2H), 6.62 (s, 1H), 3.49 (s, 3H); ^{13}C NMR (75 MHz, DMSO-d_6) δ 194.2, 154.0, 149.2, 138.4, 135.9, 132.3, 131.3, 130.6, 130.5, 128.6, 124.7, 121.0, 111.6, 110.8, 102.8, 55.7; IR (KBr): 1662, 1607, 1591, 1486, 1240, 1211, 1093, 843; HRMS (*m/z*): $[M + H]^+$ calcd for $C_{18}H_{12}Br_2ClO_3$, 468.8842 found, 468.8839. Anal. Calcd for $C_{18}H_{11}Br_2ClO_3$: C 45.95, H 2.36. Found: C 46.10, H 2.32.

Refinement

All the H atoms could be located in difference Fourier maps. All the H atoms were subsequently refined as riding atoms, with O2—H2O = 0.792, O5—H5O = 0.783, C—H = 0.950 (aromatic) and 0.980 (methyl) Å, and U_{iso}(H) = 1.2U_{eq}(C).

Figures

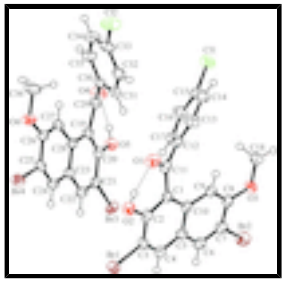

Fig. 1. The asymmetric unit of compound (I), showing 50% probability displacement ellipsoids. The intramolecular hydrogen bond is shown as a dashed line.

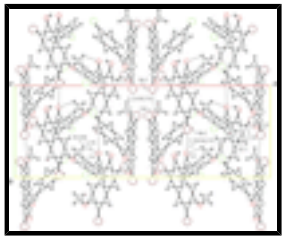

Fig. 2. Partial crystal packing diagram of compound (I), viewed down the *c* axis. Intermolecular C—H···O hydrogen bonds and Br···O halogen bonds are shown as dashed lines.

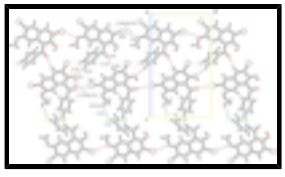

Fig. 3. Partial crystal packing diagram of compound (I), viewed down the *a* axis. Intermolecular C—H···O, C—H···Cl hydrogen bonds and Br···O halogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.031	Hydrogen site location: difference Fourier map
$wR(F^2)$ = 0.081	H-atom parameters constrained
S = 1.14	$w = 1/[\sigma^2(F_o^2) + (0.0417P)^2 + 12.8149P]$ where $P = (F_o^2 + 2F_c^2)/3$
6263 reflections	$(\Delta/\sigma)_{max}$ = 0.001
435 parameters	$\Delta\rho_{max}$ = 0.85 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −1.08 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 24 May 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 120 K; mean σ(C–C) = 0.004 Å; R factor = 0.042; wR factor = 0.127; data-to-parameter ratio = 8.9.

In the title compound, $C_{18}H_{24}$, the adamantane cage consists of three fused cyclohexane rings in almost ideal chair conformations, with C—C—C angles in the range 108.0 (14)–111.1 (15)°. The phenyl and 1-adamantyl substituents adopt *anti* orientations with a C—C—C—C torsion angle of 177.10 (16)°. In the crystal packing, the molecules are linked by weak C—H$\cdots\pi$ interactions into chains along the *a* axis.

Related literature

The title compound was prepared according to a modified procedure of Adkins & Billica (1948). For some important properties of compounds bearing the adamantane scaffold, see: van der Schyf *et al.* (2009); van Bommel *et al.* (2001). For a related structure, see: Raine *et al.* (2002).

1-(2-Phenylethyl)adamantane

M. Rouchal, M. Necas and R. Vícha

Comment

Adamantane is a molecule with an elegant structure and unique properties. The addition of the highly lipophilic adamantane cage to a known biologically active compound can significantly improve the pharmacokinetic profile of the resulting molecule, *e.g.* its oral bioavailability (van der Schyf *et al.* 2009). Moreover, the relatively stable host–guest interactions of the adamantane scaffold with β-cyclodextrin might increase the solubility of non-polar substances in polar media (van Bommel *et al.* 2001). Both these characteristics have an important role in drug design. This structure represents one of the few low-molecular-weight molecules bearing an adamantane moiety that has no polar function group. Therefore, this compound may be used as a standard molecule for investigations of non-polar interactions.

The asymmetric unit of the title compound consists of a single molecule (Fig. 1). The benzene ring is nearly planar with a maximum deviation from the best plane being 0.007 (2) Å for C16. The torsion angles describing mutual alignment of the 1-adamantyl and phenyl substituents C18—C13—C12—C11, C13—C12—C11—C1 and C12—C11—C1—C2 are -73.4 (2), -177.10 (16) and 179.59 (16)°, respectively. In the crystal packing, the molecules are arranged into chains parallel to the *a*-axis linked by weak C—H···π interactions (Fig. 2, Table 1).

Experimental

The title compound was prepared according to a modified literature procedure published by Adkins & Billica (1948). 2-(1-Adamantyl)-2-benzyl-1,3-dithiane (0.33 mmol, 114 mg) was dissolved in 5 ml of dioxane and a large excess of Raney nickel catalyst was added to this solution. The reaction mixture was stirred and refluxed under Ar atmosphere. Further portions of Raney nickel were added until the starting material was completely consumed (monitored by GC). Subsequently, the Raney nickel was filtered off, the filtrate was diluted with water and extracted with diethyl ether. The combined organic layers were washed twice with brine and dried over Na_2SO_4. The required product was obtained after evaporation of solvent in vacuum as a colorless crystalline powder (72 mg, 91%, mp 318–324 K). The crystal used for data collection was grown by spontaneous evaporation from deuterochloroform at room temperature.

Refinement

Hydrogen atoms were positioned geometrically and refined as riding using standard *SHELXTL* constraints, with their U_{iso} set to either $1.2U_{eq}$ of their parent atoms. In the absence of significant anomalous scattering, Friedel pairs were merged.

Figures

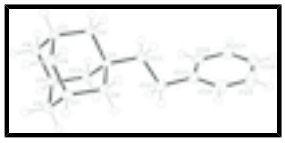

Fig. 1. *ORTEP* diagram of the asymmetric unit showing the atom labelling scheme with atoms represented as 50% probability ellipsoids.

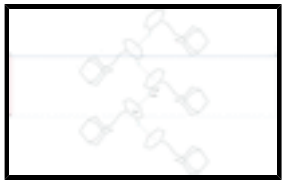

Fig. 2. A partial view of the crystal packing viewed along the *b*-axis showing the arrangement of the molecules into chains parallel to the *a*-axis stabilized by weak C—H···π interactions (dotted lines). *Cg*1 is the center of gravity of C13–C18. H-atoms (except those which are involved in H-bonding) have been omitted for clarity. Symmetry codes: (i) -*x* + 1.5, -*y* + 1, *z* + 1/2; (ii) –x+2, *y* - 1/2, -*z* + 1/2.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.042	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.127	H-atom parameters constrained
S = 1.30	$w = 1/[\sigma^2(F_o^2) + (0.0705P)^2 + 0.0787P]$ where $P = (F_o^2 + 2F_c^2)/3$
1452 reflections	$(\Delta/\sigma)_{max} < 0.001$
163 parameters	$\Delta\rho_{max}$ = 0.24 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.15 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.005 Å; R factor = 0.049; wR factor = 0.119; data-to-parameter ratio = 8.7.

The title triterpene, $C_{34}H_{52}N_2O_3$, is a C-28 carbamate derivative of betulin prepared in a one-step reaction from the commercially available 1,1′-carbonyldiimidazole (CDI). All rings are fused *trans*. The X-ray study shows the retention of the configuration of C-28 with respect to the known chiral centres of the molecule. In the crystal, the molecules are O—H···O hydrogen bonded *via* the hydroxy group and the carbonyl group of the carbamate function into chains running along the *c* axis. A quantum-mechanical *ab initio* Roothaan Hartree–Fock calculation of the equilibrium geometry of the isolated molecule gives values for bond-lengths and valency angles close to the experimental values. The calculations also reproduce the molecular conformation well, with calculated puckering parameters that agree well with the observed values.

3β-Hydroxylup-20(29)-en-28-yl 1*H*-imidazole-1-carboxylate

R. C. Santos, A. Matos Beja, J. A. R. Salvador and J. A. Paixão

Comment

Cancer is the second most important disease leading to death in both the developing and developed countries nowadays. Numerous experimental and epidemiological studies have shown that several plant derived natural products may serve as effective anticancer drugs, among which are plant triterpenes (Kinghorn *et al.*, 2004 and Setzer *et al.*, 2003). Betulin and betulinic acid, two pentacyclic lupane triterpenes were reported to display several biological effects including anti-inflammatory, antiviral, antimalarial and in particular anticancer (Dzubak *et al.*, 2006 and Tolstikova *et al.*, 2006). The therapeutic characteristics of betulinic acid regarding specificity and mode of action make it a promising anticancer agent presently under evaluation in phase I studies (Petronelli *et al.*, 2009).

As part of our current interest in the synthesis of new triterpenoid derivatives with cytotoxic activity, we have recently reported the synthesis and evaluation of novel carbamates and *N*-acylheterocyclic derivatives of betulin and betulinic acid for potential use as chemotherapeutic agents (Santos *et al.*, 2009).

The general procedure for the synthesis of the novel lupane derivatives involved dissolution of the corresponding lupanes and CDI, in THF at reflux, under N_2. The reaction of CDI with alcohols and phenols has been reported to afford either *N*-alkylimidazoles (Tang *et al.*, 2004 and Totleben *et al.*, 1997) or imidazole carboxylic esters (carbamates) (Herbez *et al.*, 2005; Moreira *et al.*, 2008; Ramos Silva *et al.*, 2007; Tang *et al.*, 2004 and Totleben *et al.*, 1997) depending both on alcohol type and on the reaction conditions used. In this case the reaction afforded the carbamate derivative 3β-hydroxy-lup-20 (29)-en-28-yl-1*H*-imidazole-1-carboxylate in good yield. This compound had been found to induce a selective dose-dependent decrease in the viability of HepG2, HeLa and Jurkat cells after 72 h of treatment according to the determined IC_{50} values (4.2 µ M, 7.6 µ M and 16.3µ M, respectively), which were 2–8 times lower than that obtained with betulinic acid.

Mindful of the biological and synthetic importance of such molecules, we report in this communication the molecular structure of the 3β-hydroxy-lup-20 (29)-en-28-yl-1*H*-imidazole-1-carboxylate determined by single-crystal X-ray diffraction, and compare it with that of the free molecule as given by a quantum mechanical *ab initio* calculation. The structure of this compound with the corresponding atomic numbering scheme is shown in Fig. 1. This triterpenoid compound is a lupane-type with an imidazole carbonyloxy at C-28. The retention of configuration of C-28 was unequivocally demonstrated by this X-ray crystallographic study.

Bond lengths and valency angles have typical values for this type of compounds. All rings are fused *trans* as shown by the angle between the least-squares planes of the rings [rings A and B: 14.63 (18)°, B and C: 10.63 (18)°, C and D: 6.67 (18)°, D and E: 4.6 (2)°]. Rings A and C have conformations close to chair while rings B and D have conformations slightly distorted from chair towards half-chair as shown by the Cremer & Pople (1975) parameters [ring A: Q = 0.545 (4) Å, θ = 5.4 (4)° and φ = 36 (5)°; B: Q = 0.571 (4) Å, θ = 11.3 (4)° and φ = 1.0 (19)°; C: Q = 0.601 (4) Å, θ = 5.7 (4)° and φ = 338 (3)°; D: Q = 0.569 (4) Å, θ = 171.1 (4)° and φ = 90 (2)°]. Ring E has a twisted conformation along the C17–C18 bond [q_2 = 0.443 (4) Å and φ_2 = 9.0 (5)° and asymmetry parameters (Duax & Norton, 1975) ΔC_2(C21) = ΔC_2(C17,18) = 11.7 (4)°].

The molecules are hydrogen bonded involving the hydroxyl group at C3 and the carbonyl group of the carbamate moiety, forming infinite chains running along the *c* axis. In addition, two short distances between C16—H16A and C28—H28B and the O28A and O28B atoms, respectively may be due to weak intramolecular C—H···O interactions.

In order to gain some insight on how the crystal packing of (I) might affect the molecular geometry we have performed a quantum chemical calculation on the equilibrium geometry of the free molecule. These calculations were performed with the computer program GAMESS (Schmidt *et al.*, 1993).

The *ab initio* calculations reproduce the observed experimental bond lengths and valency angles of the molecule well, with the exception of the bond C20—C30 for which the calculations gave a distance of 1.5103 Å instead of the observed value of 1.433 (6) Å. Also, the calculated conformations of the rings are very close to the experimental values, with the exception of ring E for which the calculations gave a conformation closer to envelope on C17, instead of the observed twisted conformation around C17–C18.

Experimental

All reagents were obtained from Sigma-Aldrich Co. THF was dried and purified before use according to standard procedures. A solution of betulin (200 mg, 0.45 mmol) and CDI (219 mg, 1.35 mmol) was refluxed in anyhdrous THF (8 ml). After 7 h the reaction was complete (TLC control). Water (30 ml) was added to the mixture and the resulting precipitate was dissolved in ethyl ether (50 ml). The aqueous phase was extracted twice with diethyl ether (2 *x* 30 ml). The organic phase was then washed with water (30 ml), brine (30 ml), dried with anhydrous Na_2SO_4, filtered, and concentrated under reduced pressure to give a yellowish solid. This solid was submitted to f.c.c. with petroleum ether 40–60°C/ethyl acetate (3:2) and afforded the title compound (246 mg, 82%). Full analytical details for this compound (MS, IR, ^{1}H and ^{13}C NMR spectroscopy data) can be found in Santos *et al.*, 2009. Recrystallization from acetone at room temperature gave colourless single crystals suitable for X-ray diffraction.

Ab initio calculations were based on a molecular orbital Roothaan Hartree-Fock method using an extended 6–31 G(d,p) basis set. Tight conditions for convergence of both the self-consistent field cycles and maximum density and energy gradient variations were imposed (10^{-6} atomic units). The program was run on the Milipeia cluster of UC-LCA (using 16 Opteron cores at 2.2 GHz, runing Linux).

Refinement

All H atoms attached to C atoms were refined as riding on their parent atoms using *SHELXL97* defaults. The H atom of the hydroxyl group was refined using an HFIX 147 instruction with U_{iso}= 1.5 U_{eq} of the O atom. The absolute configuration was not determined from the X-ray data, as the molecule lacks any strong anomalous scatterers at the Mo Kα wavelength, but was known from the synthetic route. Friedel pairs were merged for the refinement.

Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0030 (6)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key Laboratory of Fine Chemical Engineering, Changzhou University, Changzhou 213164, Jiangsu, People's Republic of China
Correspondence e-mail: chemsxq@yahoo.com.cn

Received 6 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.003 Å; R factor = 0.035; wR factor = 0.160; data-to-parameter ratio = 13.7.

In the title compound, $C_{19}H_{16}Cl_4O_4$, the two halves of the molecule are related by a crystallographic twofold rotation axis passing through the central spiro-C atom. The two non-planar six-membered heterocycles both adopt chair conformations, and the dihedral angle between the two benzene rings is 76.6 (1)°. In the crystal structure, intermolecular C—H···O hydrogen bonds link the molecules into chains along the c axis.

Comment

Owing to their characteristic axial and helical chirality, the stereochemistry of spiranes with six-membered rings has been extensively studied (Cismaş *et al.*, 2005). In the past three decades, most of these investigations were carried out with spiranes containing 1,3-dioxane units (Mihiş *et al.*, 2008; Sun *et al.*, 2010). We herein present the structure of 3,9-bis(2,4-dichlorophenyl)-2,4,8,10-tetraoxaspiro[5.5]undecane (Fig. 1).

In the title compound, a 2-fold rotation axis passes through the central spiro-C atom (C9). The two non-planar six-membered heterocycles [(O1, O2 and C7–C10) and (O1A, O2A and C7A–C10A)] both adopt chair conformations, and the dihedral angle between the two benzene rings (C1–C6 and C1A–C6A) is 76.6 (1)°. In the crystal structure, intermolecular C—H···O hydrogen bonds link the molecules to form one-dimensional chain along the *c* axis (Fig. 2).

Experimental

To a solution of 2,4-dichlorobenzaldehyde (5 mmol, 0.88 g) and pentaerythritol (3 mmol, 0.41 g) in toluene (25 ml), phosphotungstic acid (1 mol%, 16.5 mg) was added as catalyst. The mixture was refluxed for 6 h to complete the reaction. After reaction, the mixture was allowed to cool to room temperature, and dichloromethane (25 ml) was added to dissolve the product. The insoluble residues were filtered off and the filtrate was dried over anhydrous Na_2SO_4. The solvent was evaporated under vacuum and the product recrystallized from ethanol to afford a white solid (71% yield, m.p. 469–470 K). Single crystals suitable for X-ray diffraction were also obtained by evaporation of an ethanol solution.

Refinement

All H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances of 0.93–0.98 Å, and with $U_{iso}(H) = 1.2U_{eq}(C)$.

Figures

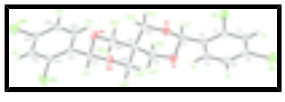

Fig. 1. The molecular structure of the title compound showing the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level [Symmetry code: -*x* + 1, *y*, -*z* + 1/2].

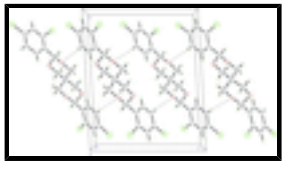

Fig. 2. One-dimensional stack running along the *c* axis. Hydrogen bonds are shown as dashed lines.

3,9-Bis(2,4-dichlorophenyl)-2,4,8,10-tetraoxaspiro[5.5]undecane

Crystal data

$C_{19}H_{16}Cl_4O_4$	$F(000) = 460$
$M_r = 450.12$	$D_x = 1.546$ Mg m^{-3}
Monoclinic, $P2/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 14.365$ (2) Å	Cell parameters from 2876 reflections
$b = 5.7397$ (9) Å	$\theta = 2.8$–$29.5°$
$c = 11.7464$ (19) Å	$\mu = 0.64$ mm^{-1}
$\beta = 93.275$ (3)°	$T = 295$ K
$V = 966.9$ (3) Å^3	Block, colorless
$Z = 2$	0.21 × 0.21 × 0.16 mm

Data collection

Bruker APEXII CCD diffractometer	1686 independent reflections
Radiation source: fine-focus sealed tube	1444 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.022$
φ and ω scans	$\theta_{max} = 25.0°$, $\theta_{min} = 1.4°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2000)	$h = -17 \rightarrow 17$
$T_{min} = 0.878$, $T_{max} = 0.905$	$k = -6 \rightarrow 6$
5044 measured reflections	$l = -13 \rightarrow 8$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.035$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.160$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.133P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
1686 reflections	$(\Delta/\sigma)_{max} = 0.001$
123 parameters	$\Delta\rho_{max} = 0.35$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.40$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 6 February 2010; accepted 20 May 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.002 Å; R factor = 0.040; wR factor = 0.102; data-to-parameter ratio = 15.6.

The molecule of the title compound, $C_{18}H_{12}N_2O_4$, is situated on a crystallographic centre of symmetry. The molecule has a zigzag structure, with two parallel symmetry-related indoline-2,3-dione fragments linked by an ethylene group at each N atom. In the crystal, the molecules stack in columns along the b axis. There are two such columns in the structure. The molecules within each column are parallel; however, the molecules in the two columns differ in the respective orientation of the indoline-2,3-dione fragments. In one column, they are approximately parallel to (112), while in the other they are approximately parallel to ($\bar{1}$12). The interplanar angle between the indoline-2,3-dione fragments in the two columns is 80.83 (3)°. The molecules within each column are related by mutual displacement of their centres of symmetry, that is (0, ±1/2, ±1/2). The packing between the molecules is provided by weak interactions only, *viz*. C—H···O hydrogen bonds and π–π [centroid–centroid distance = 3.8745 (8) Å] and C═O···π interactions.

Comment

Isatins present a wide range of important biological and pharmacological activities. Fungicide (Breinholt *et al.*, 1996), antianxiety (Norman, 1996; Breinholt *et al.*, 1996) and anticonvulsant ones (Rajopadhye & Popp, 1988) are among them. In particular, the title compound, 1,2-bis[(indolin-2,3-dion)-1-yl]ethane, and related 1,1-bis{4-[(2,3-dioxoindolin-1-yl)methyl]phenyl}methane and 1-(3,4-dichlorobenzyl)indoline-2,3-dione (Hyatt *et al.*, 2007) have been considered as potent and selective carboxylesterase inhibitors (Hyatt *et al.*, 2007). Herein, we report the structure of the title compound.

The centrosymmetric molecule takes a zigzag fashion, with two symmetric parallel indoline-2,3-dione fragments being linked by the ethylene group to the N atoms (Fig. 1). There are only weak intermolecular interactions in the structure: a π-electron—π-electron ring interaction between N1\C1\C6\C7\C8 (pyrrole) and C1\C2\C3\C4\C5\C6 (benzene) rings (symmetry code: x, y+1, z) with the distance between the respective centroids equal to 3.8745 (8) Å. A C-H···O bond is given in Tab. 1 while C═O···π-electron ring interactions are listed in Tab. 2.

The distance C7-C8 (1.5554 (19) Å) corresponds well to the pertinent distances previously observed in well determined structures with the indoline-2,3-dione fragment. The search in the Cambridge Structural Database (Allen, 2002; Cambridge Structural Database, version 5.31 and addenda up to 26 February 2010) yielded 12 hits with structures determined with R_{val}<0.05. The corresponding extremal distances from this search equalled to 1.531 and 1.578 Å for JOBDEG and NAQRAY, respectively.

Experimental

A mixture of indoline-2,3-dione (1.47 g, 10 mmol), 1,2-dibromoethane (5.64 g, 30 mmol) and K_2CO_3 (2 g, 14.5 mmol) in *N,N*-dimethylformamide (20 ml) was heated at 100-120 °C for 3 h. After cooling to room temperature, the reaction mixture was poured into 0°C water (100 ml). The resulting precipitate was separated by filtration, dried in air and then it was purified by column chromatography on a silica gel with dichloromethane/methanol = 95:5, v/v, as an eluent. The precipitate included the prevailing product 1-(2-bromoethyl)indoline-2,3-dione (R_f = 0.77, m.p. 131-132°C; yield 60.9%) as well as the the title product 1,2-bis[(indolin-2,3-dion)-1-yl]ethane (R_f = 0.64, m.p. 296-297°C; yield 13.1%). The prevailing product, 1-(2-bromoethyl)indoline-2,3-dione, has been determined by a mass spectrometric analysis while its melting point (131-132°C) corresponded to 131°C reported by Schmidt *et al.* (2008). The orange crystals of the title compound that measured 0.40 × 0.30 × 0.20 mm on average were obtained by slow evaporation from the solution of dichloromethane *N,N*-dimethylformamide 50:50 (v/v).

Refinement

All the H atoms were discernible in the difference electron density maps. Nevertheless, the hydrogen atoms were placed into the idealized positions and allowed to ride on the carrier atoms, with C—H = 0.93 and 0.97 Å for aryl and methylene hydrogens, respectively. $U_{iso}(H) = 1.2U_{eq}(C)_{aryl/methylene}$.

Figures

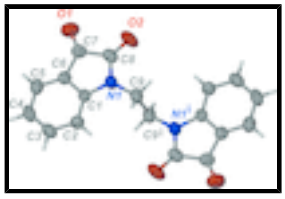

Fig. 1. The title molecule with the atomic numbering scheme. The displacement ellipsoids are shown at the 50% probability level. Symmetry code: (i): *-x*, *-y*, *-z*+1.

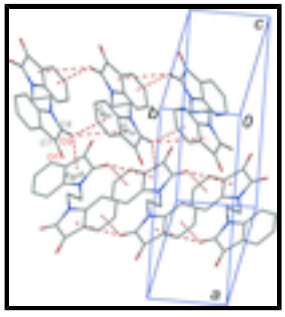

Fig. 2. The column motifs of the molecules of the title compound. The π-electron ring···π-electron ring interactions are shown as a red dashed lines. Cg1, Cg2 are the centroids of the N1-C1-C6-C7-C8 (pyrrole) and C1-C2-C3-C4-C5-C6 (benzene) rings, respectively. Symmetry codes: (i): *x*, 1+*y*, *z*; (ii): *-x*, 1/2+*y*, 3/2-*z*.

Extinction coefficient: 0.060 (5)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.003 Å; R factor = 0.040; wR factor = 0.109; data-to-parameter ratio = 16.4.

In the title compound, $C_{27}H_{18}Cl_2N_2O_2$, the 2-chloroquinoline and 6-chloroquinoline rings are almost planar, with maximum deviations from their mean planes of 0.072 (1) and 0.044 (1) Å, respectively, for the Cl atoms. The interplanar angle between these rings is 14.36 (5)°. The interplanar angle between the 6-chloroquinoline and phenyl rings is 66.00 (8)°. In the crystal, molecules are interlinked by weak C—H···O, C—H···π and π–π stacking [centroid–centroid distances = 3.7453 (10) and 3.7557 (9) Å] interactions.

Comment

Quinolones have emerged as one of the important classes among chemotherapeutic drugs for treatment of various bacterial infections. The quinolones, precisely the compounds with 2-quinolone moiety, show interesting biologic activities such as antibacterial, anticancer, antiviral and cardiotonic ones (Ukita & Mizuno, 1960; Jayashree *et al.*, 2010; Joseph *et al.*, 2002; Xiao *et al.*, 2001). In continuation of our previous work (Roopan *et al.*, 2009; Khan *et al.*, 2010), we report the structure of a new compound, 3-acetyl-2(2-chloroquinolin-3-yl)methoxy-6-chloro-4-phenylquinoline.

In the title molecule, as shown in Fig. 1, the 2-chloroquinoline (N1/C1–C9/Cl2) and 6-chloroquinoline (N2/C11—C19/Cl1) rings are almost planar, with maximal deviations from their mean planes of 0.072 (1) and of 0.044 (1) Å for Cl1 and Cl2 atoms, respectively. The interplanar angle between these rings is 14.36 (5)°. The interplanar angle between the quinoline (N2/C11—C19) and the phenyl (C20–C25) rings equals to 66.00 (8)° while the dihedral angle between the quinoline ring (N2/C11—C19) and the acetaldehyde (C26/C27/O2) group equals to 76.41 (9)°.

The molecules are linked by intermolecular C—H···O interactions (Tab. 1). The crystal structure is further stabilized by C—H···π-electron ring interactions (Tab. 1) and by π-electron···π-electron ring interactions between the pyridine ring (N2/C11– C19; its centroid is Cg1) with each of the benzene rings (C4–C9; its centroid is Cg2) and (C14–C19; its centroid is Cg3). The distances between these centroids of the respective rings are: Cg1···Cg2(1-*x*, 1-*y*, 1-*z*) = 3.7453 (10) Å and Cg1···Cg3 (1-*x*, 1-*y*, 2-*z*) = 3.7557 (9) Å.

Experimental

To a solution of 3-acetyl-6-chloro-2-hydroxy-4-phenylquinoline (297 mg, 1 mmol) in 5 ml of dimethylsulphoxide) were added solid 2-chloro-3-chloromethylquinoline (211 mg, 1 mmol) and powder Ag_2SO_4 (30 mg, 0.1 mmol). Then the mixture was refluxed at 383 K. The reaction was completed in 20 min, having been monitored by the thin layer chromatography using petroleum ether/ethyl acetate (95:5) as an eluant. The reaction mixture was then filtered to remove the catalyst, Ag_2SO_4. The filtrate liquid was added dropwise into 50 g of crushed ice. The solution was neutralized by 20 ml of 2N HCl. The precipitate was filtered, dried and re-crystallized from 10 ml of ethanol. The solution was kept for a day after which the resulting crystals were isolated and dried. Colourless block-shaped crystals measured about 0.20 mm in each direction.

Refinement

All the hydrogens were discernible in the difference electron density maps. However, they were constrained by the riding model approximation: C—$H_{methylene}$=0.97 Å; C—H_{methyl}=0.96 Å; C—H_{aryl}=0.93 Å; $U_{iso}(H_{methylene/aryl})=1.2U_{eq}(C_{methylene/aryl})$; $U_{iso}H_{(methyl)}=1.5U_{eq}(C_{methyl})$.

Figures

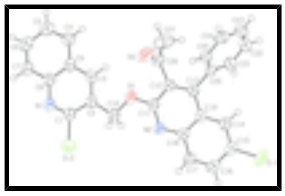

Fig. 1. A view of the title molecule, showing the atom-numbering scheme. The displacement ellipsoids are drawn at the 50% probability level.

1-{6-Chloro-2-[(2-chloro-3-quinolyl)methoxy]-4-phenyl-3-quinolyl}ethan-1-one

Crystal data

$C_{27}H_{18}Cl_2N_2O_2$	$Z = 2$
$M_r = 473.33$	$F(000) = 488$
Triclinic, $P\overline{1}$	$D_x = 1.388$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 9.2694$ (3) Å	Cell parameters from 1523 reflections
$b = 10.8862$ (4) Å	$\theta = 1.9$–$21.4°$
$c = 13.0490$ (5) Å	$\mu = 0.32$ mm^{-1}
$\alpha = 100.615$ (3)°	$T = 295$ K
$\beta = 103.570$ (3)°	Block, colourless
$\gamma = 111.894$ (4)°	0.25 × 0.21 × 0.14 mm
$V = 1132.51$ (9) Å^3	

Data collection

Oxford Xcalibur Eos (Nova) CCD detector diffractometer	4918 independent reflections
Radiation source: Enhance (Mo) X-ray Source	3250 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.037$
ω scans	$\theta_{max} = 27.0°$, $\theta_{min} = 3.1°$
Absorption correction: multi-scan (*CrysAlis PRO* RED; Oxford Diffraction, 2009)	$h = -11 \rightarrow 11$
$T_{min} = 0.925$, $T_{max} = 0.957$	$k = -13 \rightarrow 13$
24246 measured reflections	$l = -16 \rightarrow 16$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	H-atom parameters constrained
$wR(F^2) = 0.109$	$w = 1/[\sigma^2(F_o^2) + (0.0549P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{max} = 0.001$
4918 reflections	$\Delta\rho_{max} = 0.27$ e Å^{-3}
300 parameters	$\Delta\rho_{min} = -0.35$ e Å^{-3}

0 restraints

71 constraints

Primary atom site location: structure-invariant direct methods

Extinction correction: *SHELXL97* (Sheldrick, 2008), $FC^*=KFC[1+0.001XFC^2\Lambda^3/SIN(2\Theta)]^{-1/4}$

Extinction coefficient: 0.0099 (17)

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors wR and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 10 March 2010; accepted 18 May 2010

Key indicators: single-crystal X-ray study; T = 90 K; mean σ(C–C) = 0.003 Å; R factor = 0.043; wR factor = 0.112; data-to-parameter ratio = 14.2.

In the crystal structure of the title compound, $C_{21}H_{20}N_2O_4S\cdot CH_3OH$, molecules are linked into chains by a series of intermolecular N—H···O, N—H···N and O—H···O hydrogen bonds. The molecular structure shows a double bond with Z geometry, connecting the thiazolone and resveratrol units. The dihedral angle between the thiazolone ring and the nearest dimethoxybenzene ring is 53.02 (7)°.

Comment

Many natural products possessing a trimethoxybenzene ring, e.g., colchicines, and podophyllotoxins, are potent cytotoxic agents and exert their antitumor properties by their antitubulin activity. In view of the activity of such trimethoxybenzenes, similar structurally related stilbene moieties have been studied. The trihydroxy compound, resveratrol, a naturally occurring phytoalexin (trans-3, 4, 5-trihydroxystilbene) present in grapes, berries, peanuts,and red wine [Aggarwal *et al.*,2004, Pettit *et al.*, 1995) is reported to be a potential cancer chemotherapeutic agent based on its striking inhibitory effects on cellular events associated with cancer initiation, promotion, and progression. (Cushman *et al.*, 1991). These observations encouraged us to design and synthesise a series of novel trimethoxy resveratrol analogs that were expected to function as potent cytotoxic agents against lung and breast cancer cells. The structural characterization of the title compound by x-ray analysis was performed to determine the geometry (*E* vs *Z*) of the double bond connecting the thiozolone ring and the resveratrol moiety, which cannot be easily determined by NMR spectroscopic analysis, and to obtain detailed information on the structural conformation of the molecule, that may be useful in structure-activity relationship (SAR) analysis. The title compound was synthesized in two steps. In step one, the formylation of (*E*)-1, 3-dimethoxy-5- (4-methoxystyryl)benzene with a slight excess of phosphorous oxychloride in dimethylformamide at 0 °C resulted the formation of trans-2-formyl-3, 4', 5-trimethoxystilbene. In step two, the reaction of trans-2-formyl-3, 4', 5-trimethoxystilbene with the active methelene compound, 2-aminothiazol-4(*5H*)-one in presence of ammonium acetate in acetic acid under microwave irradiation conditions yielded the title compound, (*Z*)-2-amino-5-[2,4-dimethoxy-6- (4-methoxystyryl)benzylidene]thiazol-4(*5H*)-one in 90% yield. The x-ray analysis studies revealed that the double bond connecting the thiazolone and resveratrol moieties has the *Z* geometry. The dihedral angle between the plane of the thiazolone ring and the plane of the nearest phenyl ring is 53.02 (7)°. The crystal packing is stabilized by a series of N—H···O, N—H···N and O—H···O intermolecular hydrogen bonds.

Experimental

A mixture of trans-2-formyl-3,4',5-trimethoxystilbene (50 mg, 1 mmol), 2-aminothiazol-4(5*H*)-one (20.44 mg, 1.1 mmol), ammonium acetate (13.56 mg, 1.1 mmol) and acetic acid (0.25 ml) was irradiated in a domestic microwave oven for 60 sec with intermittent cooling to room temperature every 20 sec. The reaction mixture was allowed to cool to room temperature, and treated with saturated aqueous sodium bicarbonate solution. The precipitate thus obtained was collected by filtration, washed with cold water and dried, to afford the crude product. Crystallization from methanol gave a white crystalline product of (*Z*)-2-amino-5-[2,4-dimethoxy-6-(4-methoxystyryl) benzylidene]thiazol-4(5*H*)-one methanolate, which was suitable for x-ray analysis. ^{1}H NMR (DMSO-d_6): δ 3.77 (*s*, 3H, -OCH_3), 3.82 (*s*, 3H, -OCH_3), 3.86 (*s*, 3H, -OCH_3), 6.54-6.55 (*d*, *J*=2 Hz, 1H), 6.90-6.91 (*m*, 1H), 6.93-6.95 (*d*, *J*=2 Hz, 3H), 7.20-7.23 (*d*, *J*=16 Hz, 1H), 7.47-7.49 (*d*, *J*=9 Hz, 2H), 7.61 (*s*, 1H), 8.83 (*s*, 1H), 9.12 (*s*, 1H) ppm. ^{13}C NMR (DMSO-d_6): δ 55.6, 55.9, 56.3, 98.1, 102.8, 114.9, 115.9, 124.2,125.7, 128.6, 130.2, 131.6, 134.6, 138.4, 150.5, 158.9, 159.9, 161.6, 176.6, 180.3, 181.3. M. P: 172-175 °C

Refinement

H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained distances of 0.98 Å (RCH_3), 0.95 Å ($C_{Ar}H$), and with $U_{iso}(H)$ values set to either $1.2U_{eq}$ or $1.5U_{eq}$ (RCH_3, OH) of the attached atom.

$Z = 4$	

Data collection

Bruker X8 Proteum diffractometer	3911 independent reflections
Radiation source: fine-focus rotating anode	3631 reflections with $I > 2\sigma(I)$
graded multilayer optics	$R_{int} = 0.044$
Detector resolution: 5.6 pixels mm^{-1}	$\theta_{max} = 68.4°$, $\theta_{min} = 4.0°$
φ and ω scans	$h = -12 \rightarrow 12$
Absorption correction: multi-scan (*SADABS*; Bruker, 2006)	$k = -26 \rightarrow 26$
$T_{min} = 0.777$, $T_{max} = 0.968$	$l = -10 \rightarrow 10$
31098 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.112$	H-atom parameters constrained
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0357P)^2 + 2.3067P]$ where $P = (F_o^2 + 2F_c^2)/3$
3911 reflections	$(\Delta/\sigma)_{max} < 0.001$
276 parameters	$\Delta\rho_{max} = 0.51$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.30$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Acanthoic acid

Sunisa Suwancharoen, Wantanee Tommeurd, Chuttree Phurat, Nongnuj Muangsin and Surachai Pornpakakul*

Research Centre of Bioorganic Chemistry, Department of Chemistry, Faculty of Science, Chulalongkorn University, Bangkok 10330, Thailand
Correspondence e-mail: nongnuj.j@chula.ac.th

Received 4 May 2010; accepted 24 May 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.005 Å; R factor = 0.056; wR factor = 0.158; data-to-parameter ratio = 11.9.

The title compound [systematic name: (1*R*,4a*R*,7*S*,8a*S*,10a*S*)-1,4a,7-trimethyl-7-vinyl-1,2,3,4,4a,6,7,8,8a,9,10,10a-dodecahydrophenanthrene-1-carboxylic acid], $C_{20}H_{30}O_2$, is a pimarane-type diterpene extracted from *Croton oblongifolius*. There are two independent molecules in the asymmetric unit. In both of these, the six-membered rings *A*, *B* and *C* adopt chair, boat and half-chair conformations, respectively. Rings *A* and *B* are *trans*-fused. The two molecules in the asymmetric unit form O—H···O hydrogen-bonded $R_2^2(8)$ dimers. The absolute configuration was assigned on the basis of the published literature on analogous structures.

Acanthoic acid

S. Suwancharoen, W. Tommeurd, C. Phurat, N. Muangsin and S. Pornpakakul

Comment

Acanthoic acid is a pimarane-type diterpene. It was first isolated from root bark of *Acanthopanax koreanum* Nakai (Araliaceae) (Kim *et al.*, 1998) which has been used for treatment of neuralgia, hypertension, rheumatism and diabetes (Ling *et al.*, 2001). This natural product exhibits anti-inflammatory activity (Suh *et al.*, 2001). In this work, acanthoic acid was isolated in high yield from stem bark of *Croton oblongifolius* from Ratchaburi Province, Thailand.

There are two independent molecules in the asymmetric unit. In both independent molecules, the six memberred rings A, B and C adopts a chair, boat and half-chair conformations, respectively with the puckering parameters: Q = 0.546 Å, θ = 179.5° and φ = -107.0° for A, Q = 0.766 Å, θ = 89.9° and φ = -73.3° for B and Q = 0.493 Å, θ = 128.4° and φ = 35.2° for C. Rings A/B is *trans*-fused. The ethylene group substituted at C13 is in an equatorial position. The two molecules in the asymmetric unit form O—H···O hydrogen-bonded $R_2^2(8)$ dimers. The absolute configuration was assigned by comparison with the crystal structure of *p*-bromobenzoate ester-acanthoic derivative (Ling *et al.*, 2000).

Experimental

Dried powder of stem bark of *Croton oblongifolius* Roxb. (5.23 kg) from Ratchaburi province was extracted with hexane (4Lx5). The hexane crude extract was obtained as viscous yellow brown oil. This crude extract was purified by quick column chromatography on silica gel using a mixture of hexane and ethyl acetate (100:0-0:100). Fractions with similar components were combined according to TLC profile. The combined fraction eluted with a 7:3 mixture of hexane and ethyl acetate was crystallized in hexane and ethyl acetate to give colourless crystals (5.5% yield).

Refinement

Non-H atoms were refined anisotropically. H atoms were treated as riding atoms with distances C—H = 0.96 Å (CH_3), 0.97 Å (CH_2), 0.93 Å (CH), and *U*iso(H) = 1.20 *U*eq(C) for methylene and aromatic, 1.50 *U*eq(C) for methyl. The absolute structure could not be determined from the X-ray analysis, but it is known from earlier work on related compounds (Ling

et al., 2000). In the absence of significant anomalous scattering effects, 3,697 Friedel pairs were therefore merged before the final refinement.

Figures

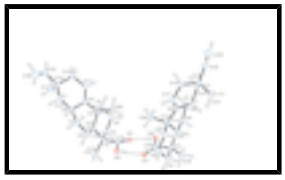

Fig. 1. The asymmetric unit of the title compound showing two independent molecules. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. Hydrogen bonds are shown as dashed lines.

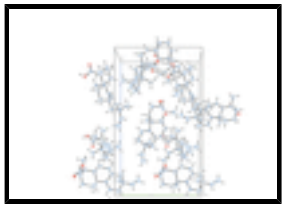

Fig. 2. The crystal structure of the title compound viewed along the *a*-axis.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Received 7 May 2010; accepted 26 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.041; wR factor = 0.112; data-to-parameter ratio = 15.1.

The asymmetric unit of the title compound, $C_{22}H_{18}N_2O_2$, contains two independent molecules, which differ in the orientations of the benzyl groups with respect to the planar (r.m.s. deviations of 0.031 and 0.020 Å) quinazoline-2,4-dione skeletons [dihedral angles of 73.97 (4) and 70.07 (4)° in the first molecule and 75.63 (4) and 63.52 (3)° in the second]. The crystal structure is stabilized by weak intermolecular C—H···O and C—H···π interactions and aromatic π–π stacking interactions [centroid–centroid distance = 3.735 (2) Å].

1,3-Dibenzyl-1,2,3,4-tetrahydroquinazoline-2,4-dione

G. Karimova, J. Ashurov, N. Mukhamedov, N. A. Parpiev and K. M. Shakhidoyatov

Comment

Quinazoline-2,4-diones have been frequently used as intermediates and synthetic precursors for the preparation of a wide variety of heterocyclic compounds (Kuryazov *et al.*, 2008). In addition, they possess different biological activities (Colottaa *et al.*, 2004; Yakhontov *et al.*, 1977).

The title compound consists of a quinazoline-2,4-dione skeleton with two benzyl groups. The asymmetric unit contains two molecules of 1,2,3,4-tetrahydro-1,3-dibenzylquinazoline-2,4-dione (Fig.1). Orientation of benzyl groups with respect to the planar quinazoline-2,4-dione skeletons are different for independent molecules. Dihedral angles between planar quinazoline-2,4-dione system and benzyl group planes are 73.97 (4)° and 70.07 (4)° (for molecule A) and 75.63 (4)° and 63.52 (3)° (for molecule B). Torsion angles responsible for orientation of benzyl groups are shown in table 1. (In order compare torsions between A and B independent molecules must be taken absolute values of torsion angles).

Quinazoline-2,4-dione system of the molecules are packed into sheets along *b* axis by a aromatic π–π stacking interaction. The benzene rings in the quinazoline-2,4-dione system standing nearly parallel (molecules A and B) are separated with distance of 3.477 (2) Å and benzene ring-centroid separation is 3.735 (2) Å with ring offset of 1.364 (2) Å. This distances for molecules of A at (*x*,*y*,*z*) and B at (1.5 - *x*, 1/2 + *y*, *z*) are 3.493 (2) Å, 3.791 (2) Å and 1.473 (2) Å.

The observed structure is stabilized by weak C—H···O and C—H···C_{ar} type hydrogen bonds (Table 2). The bond distances and angles in organic compound molecules are in normal ranges (Allen *et al.*, 1987).

Experimental

To suspension of 1*H*-quinazoline-2,4-dione (1.62 g) in 40 ml benzene was added 10% aqueous solution of sodium hydroxide (40 ml), tetrabutylammonium bromide (1.29 g, 4 mmol) and benzyl chloride (3.80 g, 30 mmol). The mixture was heated until 60° C and helded out for 6 h (Hedayatullah, 1981). The organic layer was separated, washed with water until neutral reaction and dryed with Na_2SO_4, benzene was evaporated. Residue was recrystallized from benzene and obtained in 88% yield (3.02 g) of title compound. Colorless crystals suitable for X-ray analysis were obtained from dimethylformamide by slow evaporation.

Refinement

Carbon-bound H atoms were positioned geometrically and treated as riding on their C atoms, with C—H distances of 0.93 Å (aromatic) and 0.97 Å (CH_2) and were refined with U_{iso}(H)=1.2Ueq(C).

Figures

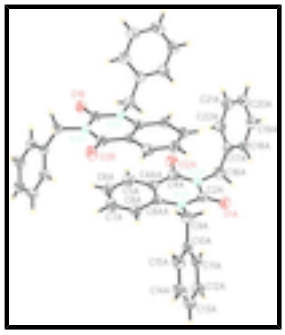

Fig. 1. Asymmetric unit of cell with atom labels and 30% probability displacement ellipsoids for non-H atoms.

1,3-Dibenzyl-1,2,3,4-tetrahydroquinazoline-2,4-dione

Crystal data

$C_{22}H_{18}N_2O_2$	D_x = 1.309 Mg m^{-3}
M_r = 342.38	Melting point: 398(2) K
Orthorhombic, *Pbca*	Cu *K*α radiation, λ = 1.54184 Å
Hall symbol: -P 2ac 2ab	Cell parameters from 2463 reflections
a = 17.8989 (4) Å	θ = 3.5–35.8°
b = 14.0071 (4) Å	μ = 0.68 mm^{-1}
c = 27.7222 (6) Å	*T* = 293 K
V = 6950.3 (3) Å^3	Prism, colourless
Z = 16	0.5 × 0.4 × 0.35 mm
F(000) = 2880	

Data collection

Oxford Diffraction Xcalibur Ruby diffractometer	7088 independent reflections
Radiation source: Enhance (Cu) X-ray Source	4141 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.030
Detector resolution: 10.2576 pixels mm^{-1}	θ_{max} = 75.8°, θ_{min} = 4.0°
ω scans	*h* = −22→18
Absorption correction: multi-scan (*CrysAlis PRO*; Oxford Diffraction, 2009)	*k* = −11→17
T_{min} = 0.804, T_{max} = 1.000	*l* = −31→34
18947 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)]$ = 0.041	H-atom parameters constrained
$wR(F^2)$ = 0.112	$w = 1/[\sigma^2(F_o^2) + (0.0587P)^2]$

	where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.90$	$(\Delta/\sigma)_{max} = 0.002$
7088 reflections	$\Delta\rho_{max} = 0.28$ e Å^{-3}
470 parameters	$\Delta\rho_{min} = -0.14$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.00081 (5)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 10 May 2010; accepted 14 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.005 Å; disorder in main residue; R factor = 0.043; wR factor = 0.103; data-to-parameter ratio = 22.0.

The title compound, $[Cu_4(C_2F_3O_2)_3(C_4H_{10}NO)_3Cl(OH)]\cdot C_4H_8O$ or $[Cu_4(TFA)_3(dmae)_3Cl(OH)]\cdot THF$ (dmae is dimethylaminoethanolate, TFA is trifluoroacetate and THF is tetrahydrofuran), has an approximate molecular threefold symmetry with three equivalent {Cu(dmae)(TFA)} units bridging between a Cu—Cl and a hydroxide unit, with the latter two lying on the molecular threefold axis. However, in the solid state, the tetranuclear complex has C_i symmetry. The Cu atom bonded to the Cl atom has a distorted tetrahedral geometry. The other three Cu atoms have distorted square-pyramidal geometries with an NO_4 coordination environment. The bonds within the $CuNO_3$ base of the pyramid range from 1.953 (2) to 2.033 (3) Å, while the apical Cu—O bonds are significantly longer, ranging from 2.286 (2) to 2.377 (2) Å. The square-pyramidal geometries are augmented by weak interactions towards a sixth O atom, forming a highly distorted octahedral coordination environment [long Cu—O distances = 2.712 (2)–2.824 (2) Å]. The hydroxide group is hydrogen bonded to the tetrahydrofuran solvent molecule. One of the $-CF_3$ groups shows minor disorder over two positions, with a refined occupancy ratio of 0.894 (4):0.106 (5).

Chloridotris[μ_2-2-(dimethylamino)ethanolato]-μ_3-hydroxido-tri-μ_2-trifluoroacetato-tetracopper(II) tetrahydrofuran solvate

S. T. Hussain, S. A. Bakar, M. Mazhar and M. Zeller

Comment

In recent years, there has been a considerable interest towards the synthesis of copper complexes; these complexes are extensively used in catalysis, enzymatic reactions, magnetism and molecular architecture (Coastamagna, Vargas *et al.*, 1992). The present work is a continuation of earlier studies for the preparation and structure eludication of copper (II) complexes (Shahid *et al.*, 2009). The motivation behind the synthesis of the title compound was to use it as a starting material for the synthesis of single source precursors for the deposition of thin films of copper oxides using aerosol assisted chemical vapor deposition (AACVD). We present here the synthesis and crystal structure of the title compound, $[Cu_4((CH_3)_2NCH_2CH_2O)_3(F_3CCOO)_3(OH)Cl]$ or $[Cu_4(dmae)_3(TFA)_3(OH)Cl]$ (dmae = dimethylaminoethanolate, TFA = trifluoroacetate), which crystallized from THF as the mono solvate with the THF molecule tightly hydrogen bonded to the hydroxyl group.

The title compound has a slightly distorted molecular three fold symmetry with three equivalent Cu(dmae)(TFA) units bridging *via* their alcoholate oxygen atoms between a Cu—Cl and an hydroxyl unit with the latter two lying on a molecular pseudo threefold axis. The Cu atom bonded to the chlorine has a distorted tetrahedral geometry. The other three copper atoms have distorted square pyramidal geometries with a CNO_4 coordination environment from the dmae O and N atoms, the hydroxyl O atom and two TFA anions. The TFA anions are bridging between two neighboring copper ions with one of the oxygen atoms being part of the base of the pyramid of one copper ion, and the other being in the apical position of the neighboring copper ion. The bonds within the $CuNO_3$ bases of the pyramids are strong and quite similar in length with distances between 1.953 (2) and 2.033 (3) Å. The apical Cu—O bonds are significantly longer and between 2.286 (2) and 2.377 (2) Å, thus rendering the μ_2-bridge of the TFA ions asymmetric. The square pyramidal geometries are augmented by weak interactions towards a fifth oxygen atom to form a highly distorted octahedral coordination environment (Cu—O distances: O3—Cu3 = 2.712 (2), O2—Cu2 = 2.780 (2), O1—Cu4 = 2.8240 (2) Å).

A similar motif as in the title compound was previously observed for two mixed metal copper-titanium complexes (Tahir *et al.*, 2008). In these complexes the TFA anions were replaced by benzoate or 2-methyl-benzoate ligands, and the Cu—Cl unit was replaced by a titanium atom, which in turn was bonded to another larger Cu—Ti cluster. The $[Cu_3(dmae)_3(TFA)_3(OH)]$ unit in the title compound and the $[Cu_3((CH_3)_2NCH_2CH_2O)_3(O_2C—C_6H_5R)_3(OH)]$ units in the Cu—Ti complexes (*R* = H, Me) are quite similar. In the 2-methyl-benzoate complexes the $[Cu_3((CH_3)_2NCH_2CH_2O)_3(O_2C—C_6H_5Me)_3(OH)]$ unit is located on an actual crystallographic three fold axis. The carboxylate anions show coordination modes differing slightly from those observed in the title compound with some of the oxygen atoms being detached from the copper ions and interactions to the fifth oxygen atom, which are very weak in the title compound, being strengthened instead. The overall coordination environment - distorted square pyramidal CNO_4 geometries with an additional weak interaction towards a fifth oxygen atom - is however the same in all three compounds, which shows the idiosyncracy commonly observed for copper(II) to form strongly distorted and highly flexible octahedral geometries with a set of four strong bonds in a square planar arrangement and two apical ligands at variable distances. Indi-

vidual ligand atoms in these kinds of complexes can easily switch from tightly bound to only weakly coordinated as long as the overall coordination environment of the metal center is retained, and energy differences and activation barriers between the different arrangements that can be achieved that way are quite small. The difference in bonding arrangement in the three complexes in the solid state does thus probably not translate into a different chemical nature for the three complexes as the bonding environment around Cu(II) is very flexible and it can be assumed that in solution (*i.e.* upon release of packing effects) all complexes will attain the same connectivity pattern.

In the title compound the hydroxyl group is O—H···O hydrogen bonded to a tetrahydrofuran molecule (Table 1), which is embedded in a bowl shaped cleft of the complex formed by the three TFA ligands. No such host–guest behavior was observed for the other two related compounds (Tahir *et al.*, 2008).

Experimental

Tetrameric *N*,*N*-dimethylaminoethanolato copper(II) chloride, $[Cu(dmae)Cl]_4$ was prepared according to a literature method (Anwander *et al.*, 1997). The title compound was prepared as follows: 1.25 g (1.67 mmole) of $[Cu(dmae)Cl]_4$ in 20 ml THF were combined with 1.77 g (6.66 mmole) of $Cu(F_3CCOO)_2$ in 10 ml THF followed by the addition of 0.297 g (3.33 mmole) *N*,*N*-dimethylaminoethanol. The reaction mixture was stirred for 3 h and filtered through a cannula to remove any undissolved species. The filtrate was evaporated to dryness under vacuum, the solid was re-dissolved in 5 ml THF and placed in a vial with rubber seal at room temperature for one week to give blue crystals suitable for single-crystal X-ray diffraction analysis. Yield: 86% m.p. 393–394 K. Elemental Analysis for $Cu_4((CH_3)_2NCH_2CH_2O)_3(F_3CCOO)_3(OH)Cl$ % calc: C, 21.99 H, 3.97 N, 4.27, % found: C, 22.10 H, 3.90 N, 4.53.

Refinement

The fluorine atoms bonded to C14 were refined as disordered over two mutually exclusive positions with a refined occupancy ratio of 0.894 (4) to 0.106 (5). C—F bond distances within this CF_3 group were restrained to be the same within a standard uncertaincy of 0.02 Å and ADPs of the minor F atoms were constrained to be identical to those of the major moiety F atom opposite their position.

All hydrogen atoms were added in calculated positions with a C—H bond distances of 0.97 (methylene), 0.96 (methyl) and 1.00 Å (OH). They were refined with isotropic displacement parameteres U_{iso} of 1.5 (methyl, OH) or 1.2 times U_{eq} (methylene) of the adjacent carbon or oxygen atom.

Special details

Experimental. The fluorine atoms bonded to C14 were refined as disordered over two mutually exclusive positions with a refined occupancy ratio of 0.894 (4) to 0.106 (5). C-f bond distances within this CF3 group were restrained to be the same within a standard uncertaincy of 0.02 Angstrom and ADPs of the minor F atoms were constrained to be identical to those of the major moiety F atom opposite their position.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4-Methylanilinium *p*-toluenesulfonate

Rui-jun Xu

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 210096, People's Republic of China
Correspondence e-mail: youyoubanzhen@126.com

Received 18 May 2010; accepted 6 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.041; wR factor = 0.093; data-to-parameter ratio = 18.0.

The crystal structure of the title compound, $C_7H_{10}N^+\cdot C_7H_7O_3S^-$, displays strong N—H···O and N—H···S hydrogen bonding between the ammonium group and the *p*-toluenesulfonate anion, linking the cations and anions into chains along the *b* axis.

4-Methylanilinium *p*-toluenesulfonate

R. Xu

Comment

Dielectric-ferroelectric as an interesting class of materials, there are organic ligands (Li *et al.*, 2008), metal-organic coordination compounds (Hang *et al.*, 2009) and organic-inorganic hybrid. In this article, the preparation and crystal structure of the title compound have been presented. It should be not a real ferroelectrics or there may be no distinct phase transition occurred within the measured temperature range. Similarly, below the melting point (477 K) of the compound, the dielectric constant as a function of temperature also goes smoothly, and there is no dielectric anomaly observed.

The asymmetric unit of the title compound contains a (CH_3—C_6H_4—NH_3^+) cation and an (CH_3—C_6H_4—SO_3^-) anion (Fig.1). The strong N—H···S, N—H···O hydrogen bonds involving H1D and H1E (N1···S1 3.570 (3) Å and N1···O1 2.829 (3) Å) are beneficial to the stability of the crystal structure and link the cations and anions to chains along the *b* axis (Fig. 2 and Tab. 1).

Experimental

The title compound was obtained by the addition of *p*-toluenesulfonic acid (3.78 g, 0.022 mol) to a solution of 4-methylaniline (2.14 g, 0.02 mol) in ethanol, in the stoichiometric ratio 1.1:1. After two weeks, good quality single crystals were obtained by slow evaporation.

Refinement

Positional parameters of all the H atoms were calculated geometrically and the H atoms were set to ride on the C and N atoms to which they are bonded, with U_{iso}(H) = 1.2Ueq(C or N).

Figures

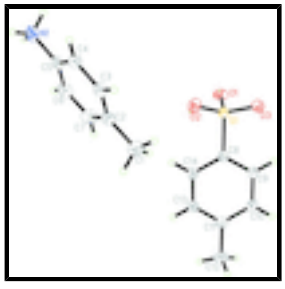

Fig. 1. The molecular structure of the title compound, showing the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

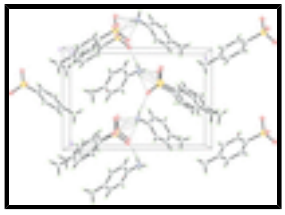

Fig. 2. A view of the packing of the title compound, stacking along the *b* axis. Dashed lines indicate hydrogen bonds.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.041$	H-atom parameters constrained
$wR(F^2) = 0.093$	$w = 1/[\sigma^2(F_o^2) + (0.0447P)^2 + 0.128P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.99$	$(\Delta/\sigma)_{max} < 0.001$
3136 reflections	$\Delta\rho_{max} = 0.18$ e Å^{-3}
174 parameters	$\Delta\rho_{min} = -0.23$ e Å^{-3}

1 restraint	Absolute structure: Flack (1983), 1448 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.05 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 May 2010; accepted 26 May 2010

Key indicators: single-crystal X-ray study; T = 113 K; mean σ(C–C) = 0.001 Å; R factor = 0.039; wR factor = 0.107; data-to-parameter ratio = 32.0.

In the title compound, $C_6H_{10}N_3^+\cdot C_5H_6O_6P^-$, the cation and anion are linked by pairs of N—H···O hydrogen bonds. There are additional intermolecular N—H···N hydrogen bonds., which generate centrosymmetric tetramers of two cations and two anions

2-Amino-4,6-dimethylpyrimidin-1-ium 1-oxo-2,6,7-trioxa-1λ^5-phosphabicyclo[2.2.2]octane-4-carboxylate

X.-F. Hou, G.-C. Li and P.-Y. Lai

Comment

Caged bicyclic phosphates are widely used as flame retardants or pesticides (Li *et al.* 2000). It can also serve as host–guest systems and have been studied in the context of hydrogen-bond patterns (Guo & Zang, 2008; Wang *et al.*, 2007). Aminopyrimidine derivatives are biologically important compounds as they occur in nature as components of nucleic acids (Meng *et al.*, 2009). The crystal structures of aminopyrimidine carboxylates have been reported (Thakur *et al.*, 2008). We report here the crystal structure of a new bicyclic phosphate cage compound.

In the title compound, $[C_6H_{10}N_3]^+$ $[C_5H_6O_6P]^-$, The cation and anion in the asymmetric unit are linked by N—H···O hydrogen bonds. There is also addition intermolecular N—H···N hydrogen bonds. (Fig. 2).

Experimental

The title compound was obtained by reaction of 1-oxo-2,6,7-trioxa-1-phosphabicyclo[2.2.2]octane-4-carboxylic acid (0.39 g, 0.2 mmol) and 2-amino-4,6-dimethylpyrimidine(0.25 g, 0.2 mmol) in refluxing acetone (50 ml). The solvent was evaporated *in vacuo*. The title compound was recrystallized from ethanol and single crystals of (I) were obtained by slow evaporation.

Refinement

All H atoms were placed in calculated positions, with C—H = 0.98 Å or 0.99 Å, and included in the final cycles of refinement using a riding model, with U_{iso}(H) = 1.2Ueq(C).

Figures

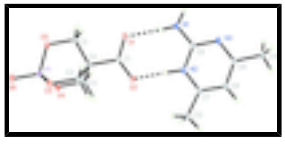

Fig. 1. The asymmetric unit of the title compound, (I), with displacement ellipsoids drawn at the 30% probability level.

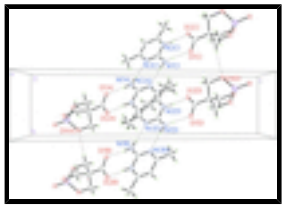

Fig. 2. The packing diagram of the title compound. Intermolecular hydrogen bonds are shown as dashed line.

$Z = 4$	

Data collection

Rigaku Saturn724 CCD diffractometer	6532 independent reflections
Radiation source: rotating anode	4883 reflections with $I > 2\sigma(I)$
multilayer	$R_{int} = 0.035$
Detector resolution: 14.222 pixels mm^{-1}	$\theta_{max} = 36.5°$, $\theta_{min} = 1.7°$
ω scans	$h = -15 \rightarrow 14$
Absorption correction: multi-scan (*CrystalClear*; Rigaku/MSC, 2009)	$k = -10 \rightarrow 10$
$T_{min} = 0.947$, $T_{max} = 0.969$	$l = -36 \rightarrow 39$
23989 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.107$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0615P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
6532 reflections	$(\Delta/\sigma)_{max} = 0.001$
204 parameters	$\Delta\rho_{max} = 0.54$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

6-(Trifluoromethyl)pyrimidine-2,4(1*H*,3*H*)-dione monohydrate

Gong-Chun Li, Hong-Sheng Wang, Yu-Jiao Niu and Feng-Ling Yang*

College of Chemistry and Chemical Engineering, Xuchang University, Xuchang, Henan Province 461000, People's Republic of China
Correspondence e-mail: actaeli@gmail.com

Received 27 May 2010; accepted 13 June 2010

Key indicators: single-crystal X-ray study; T = 113 K; mean σ(C–C) = 0.002 Å; R factor = 0.036; wR factor = 0.100; data-to-parameter ratio = 13.0.

The title compound, $C_5H_3F_3N_2O_2\cdot H_2O$, was prepared by the reaction of ethyl 4,4,4-trifluoro-3-oxobutanoate with urea. In the crystal, the 6-(trifluoromethyl)pyrimidine-2,4(1*H*,3*H*)-dione and water molecules are linked by N—H···O and O—H···O hydrogen bonds. A ring dimer structure is formed by additional intermolecular N—H···O hydrogen bonds.

6-(Trifluoromethyl)pyrimidine-2,4(1*H*,3*H*)-dione monohydrate

G.-C. Li, H.-S. Wang, Y.-J. Niu and F.-L. Yang

Comment

Pyrimidine derivatives are very important molecules in biology and have many application in the areas of pesticide and pharmaceutical agents (Condon *et al.*, 1993). For example, imazosulfuron, ethirmol and mepanipyrim have been commercialized as agrochemicals (Maeno *et al.*, 1990). Pyrimidine derivatives have also been developed as antiviral agents, shch as AZT, which is the most widely used anti-AIDS drug (Gilchrist, 1997). Recently, a new series of highly active herbicides of substituted azolylpyrimidines were reported (Selby *et al.*, 2002). In order to discover further biologically active pyrimidine compounds, the title compound, (I), was synthesized and its crystal structure determined (Fig. 1).

In the crystal strucrure, The part of 6-(trifluoromethyl)pyrimidine-2,4(1*H*,3*H*)-dione and water molecule are linked by N—H···O and O—H···O hydrogen bonds. The ring dimer structure is formed by addition intermolecular N—H···O hydrogen bonds.

Experimental

To 35 ml absolute ethanol sodium (1.38 g, 60 mmol) was added. When sodium was dissppeared, ethyl 4,4,4-trifluoro-3-oxobutanoate(5.50 g, 30 mmol) and urea (1.80 g, 30 mmol) were added to the solution. The mixture was refluxed for 20 hr., The solvent was evaporated *in vacuo* and the residue was washed with water. The title compound was recrystallized from water and single crystals of (I) were obtained by slow evaporation.

Refinement

All H atoms were placed in calculated positions, with C—H = 0.95 Å, O—H = 0.86 Å or 0.825 Å, and included in the final cycles of refinement using a riding model, with U_{iso}(H) = 1.2Ueq(C).

Figures

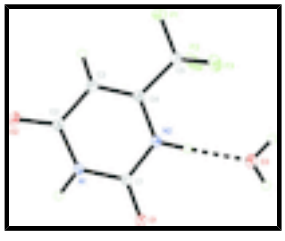

Fig. 1. The asymmetric unit of the title compound, (I), with displacement ellipsoids drawn at the 30% probability level.

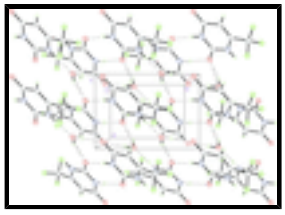

Fig. 2. The packing diagram of the title compound. Intermolecular hydrogen bonds are shown as dashed line.

$c = 20.769$ (2) Å	$\mu = 0.19$ mm^{-1}
$\beta = 91.300$ (7)°	$T = 113$ K
$V = 735.16$ (17) Å^3	Prism, colorless
$Z = 4$	0.24 × 0.20 × 0.18 mm

Data collection

Rigaku Saturn724 CCD diffractometer	1747 independent reflections
Radiation source: rotating anode	1382 reflections with $I > 2\sigma(I)$
multilayer	$R_{int} = 0.029$
ω scans	$\theta_{max} = 27.9°$, $\theta_{min} = 2.0°$
Absorption correction: multi-scan (*CrystalClear*-SM Expert; Rigaku/MSC, 2009)	$h = -6 \rightarrow 6$
$T_{min} = 0.956$, $T_{max} = 0.966$	$k = -6 \rightarrow 9$
6863 measured reflections	$l = -27 \rightarrow 27$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.100$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0589P)^2 + 0.0166P]$ where $P = (F_o^2 + 2F_c^2)/3$
1747 reflections	$(\Delta/\sigma)_{max} < 0.001$
134 parameters	$\Delta\rho_{max} = 0.33$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.21$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.036; wR factor = 0.092; data-to-parameter ratio = 17.5.

The title compound, $(C_6H_9N_2)_2[Cu(C_6H_2N_2O_4)_2(H_2O)_2]\cdot 6H_2O$, consists of a mononuclear *trans*-$[Cu(pzdc)_2(H_2O)_2]^{2-}$ dianion (pzdc is pyrazine-2,3-dicarboxylate) and two $[ampyH]^+$ cations (ampy is 2-amino-4-methylpyridine) with six water molecules of solvation. The Cu^{II} atom is hexacoordinated by two pzdc groups and two water molecules. The coordinated water molecules are in *trans*-diaxial positions and the pzdc dianion acts as a bidentate ligand through an O atom of the carboxylate group and the N atom of the pyrazine ring. There are diverse hydrogen-bonding interactions, such as N—H···O and O—H···O contacts, which lead to the formation of a three-dimensional supramolecular architecture.

Bis(2-amino-4-methylpyridinium) *trans*-diaquabis(pyrazine-2,3-dicarboxylato)cuprate(II) hexahydrate

H. Eshtiagh-Hosseini, F. Gschwind, N. Alfi and M. Mirzaei

Comment

Dicarboxylate ligands are widely used to assemble supramolecular network organized by coordination bonds, hydrogen bonds and π –π stacking interaction. Due to the manifold N- and O-donors of pyridine or pyrazine-(di)carboxylic ligands, metal pyridine- or pyrazine dicarboxylates can contrast versatile structural motifs, which finally aggregate to generate various supramolecular architectures with interesting properties. As ones of the dicarboxylate ligands, $pzdcH_2$ have drawn extensive attentions. For the first time, Takusagawa & Shimada (1973) by single crystal X-ray diffraction, determined the structure of $pzdcH_2$. Continuing with our previous works on synthesizing coordination compounds *via* proton transfer mechanism including zinc atom (Eshtiagh-Hosseini *et al.*, 2010a), manganese atom (Eshtiagh-Hosseini *et al.*, 2010b), Bis(2,4,6-triamino-1,3,5-triazin-1-ium) pyrazine-2,3-dicarboxylate tetrahydrate (Eshtiagh-Hosseini *et al.*, 2010c), herein, we planned the reaction between $pzdcH_2$, ampy, and copper(II) choloride which resulted in the formation of $(ampy)_2[Cu(pzdc)_2(H_2O)_2].6H_2O$ (Fig. 1). Crystal packing diagram related to the title compound is also rendered in the Fig. 2. As you can see, the equatorial plane is occupied by two $(pzdc)^{2-}$ ligands coordinating through the pyridine nitrogen and one oxygen of the deprotonated carboxylate groups. The two coordinated water molecules occupy axial plane. This compound consists of an anionic moiety, *trans*-$[Cu(pzdc)_2(H_2O)_2]^{2-}$ complex, counter-ions, $(ampy)^+$, and six uncoordinated water molecules. The Cu—O and Cu—N bond distances related to $(pzdc)^{2-}$ ligand in herein presented compound are in the category of 1.9644 (13) Å , and 1.9840 (14) Å, respectively. These observerd bond lenghts are comprable with Zn(II) polymeric coordination compound which recently reported by our research group (Eshtiagh-Hosseini *et al.*, 2010a). In this polymeric compound which consist of only $(pzdc)^{2-}$ coordinative ligand, $\{(C_3H_{12}N_2)_2[Zn(C_{10}H_2O_8)_2]\}_n$, Zn—O and Zn—N bond distances are 2.0317 (15) to 2.2437 (15) Å, and 2.0901 (18) Å, respectively. These data show in this polymeric compound Zn—O bond distance is longer than herein presented compound. The intermolecular forces between the anionic and cationic parts in the title compound consist of hydrogen bonding and ion pairing interactions. Indeed, six uncoordinated water molecules increase the number of hydrogen bonds in the crystalline network and lead to the formation of $(H_2O)_n$ clusters throughout the crystalline network (see Review article by Aghabozorg *et al.* 2010).

Experimental

A solution of $pzdcH_2$ (0.18 mmol, 0.03 mg) in water (10 ml) refluxed for 1 hr, then a solution of $CuCl_2.6H_2O$ (0.02 mmol, 0.01 g) was added dropwise and continued refluxing for 6 hrs at 60°C. The obtained blue solution gave blue block like crystals of title compound after slow evaporation of solvent at room temperatur.

Refinement

The space group was confirmed by using PLATON software package. The structure was solved by direct methods using SHELXS-97 and refined using full matrix least-squares on F^2 with the SHELX-97 package. H-Atoms were constrained to the parent site using a rigid model. A final verification of possible voids was performed using the VOID routine on PLATON software.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.036	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.092	H atoms treated by a mixture of independent and constrained refinement
S = 1.03	$w = 1/[\sigma^2(F_o^2) + (0.0453P)^2 + 0.5453P]$ where $P = (F_o^2 + 2F_c^2)/3$
4684 reflections	$(\Delta/\sigma)_{max}$ = 0.001
268 parameters	$\Delta\rho_{max}$ = 0.36 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.52 e Å^{-3}

Special details

Experimental. Absorption correction: Interpolation using Int. Tab. Vol. C (1992) p. 523, Tab. 6.3.3.3 for values of muR in the range 0-2.5, and Int. Tab. Vol. II (1959) p. 302; Table 5.3.6 B for muR in the range 2.6-10.0. The interpolation procedure of C. W. Dwiggins Jr is used with some modification.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 28 May 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 90 K; mean σ(C–C) = 0.002 Å; R factor = 0.036; wR factor = 0.110; data-to-parameter ratio = 13.9.

In the title molecule, $C_{18}H_{23}NO_3$, the hydroperoxybutyl substituent is nearly fully extended, with the four torsion angles in the range 170.23 (10)–178.71 (9)°. The O—O distance in the hydroperoxide group is 1.4690 (13) Å. This group acts as an intermolecular hydrogen-bond donor to a quinoline N atom. This results in dimeric units about the respective inversion centers, with graph-set notation $R_2^2(18)$.

4-(8-Ethoxy-2,3-dihydro-1*H*-cyclopenta[*c*]quinolin-4-yl)butane-1-peroxol

J. Fotie, C. F. Fronczek, K. A. Burns, F. R. Fronczek, C. Bain, D. S. Bohle and F. P. Poudeu

Comment

Dihydroquinolines are mainly known for their antioxidant activity (Thorisson *et al.*, 1992, Lockhart *et al.*, 2001) although they have also been reported to possess anti-inflammatory (Dillard *et al.*, 1973), fungicidal (Cracknell *et al.*, 1998), antiatherosclerotic (Babiak *et al.*, 1999), and hormone receptor modulator (Takahashi *et al.*, 2006) properties. Furthermore, 6-ethoxy-1,2-dihydro-2,2,4-trimethylquinoline, also known as ethoxyquin, is a FDA approved antioxidant commonly used as a preservative in the food processing industry (Shah *et al.*, 2005). We have recently reported some dihydroquinoline derivatives with outstanding antitrypanosomal activity (Fotie *et al.*, 2010). In our effort to optimize the trypanocidal activity of this family of compound, we have synthesized the title compound, an unusual hydroperoxybutylquinoline derivative. Here we are reporting the characterization of that compound using ^{1}H– and ^{13}C-NMR spectroscopy, mass spectrometry, and single-crystal diffraction.

The molecular structure of the title compound is illustrated in Fig. 1. The 10-atom quinoline ring system is essentially planar, with mean deviation 0.009 Å and maximum deviation 0.017 (1) Å for both N1 and C11. The five-membered ring has the envelope conformation, with C9 at the flap position, 0.340 (2) Å out of the quinoline plane. The hydroperoxybutyl chain is extended, with torsion angle magnitudes in the range 170.23 (10) to 178.71 (9)°, and the best plane of its four C and two O atoms is approximately perpendicular to the quinoline plane, forming a dihedral angle of 89.53 (3)°. The hydroperoxy O—O distance, 1.4690 (13) Å agrees well with literature values for this group. The mean value of the 135 such distances in the Cambridge Structural Database (version 5.31, Nov. 2009; Allen 2002), after rejecting eight outliers, is 1.462 Å.

The hydroperoxide donates an intermolecular hydrogen bond to quinoline N1, with O···N distance 2.7466 (14) Å, forming discrete dimers having graph set (Etter, 1990) $R^2_2(18)$ about inversion centers, as illustrated in Fig. 2.

Experimental

The title compound was prepared by heating to reflux for three days, a mixture of *p*-phenitidine (500 mg, 3.6 mmol) and cyclopentanone (10 ml, large excess) in the presence of catalytic amounts of iodine (93 mg) and benzoyl peroxide (8.8 mg). After appropriate work-up, and purification on a silica gel column, crystals were carefully grown at room temperature, in a mixture of hexanes-dichloromethane, over the course of a week.

Mp: 131.3 - 131.6 °C. The melting point was recorded on a MEL-TEMP ELECTROTHERMAL digital melting point apparatus, and is not corrected.

ESIMS *m/z* (%): 316 (90) $[M + CH_3]^+$, 302 (43) $[M + H]^+$, 286 (100) $[M -16]^+$, 284 (94) $[M - H_2O]^+$. These fragment ions are consistent with a molecular formula of $C_{18}H_{23}NO_3$. The ESIMS spectrum was recorded on a Finnigan LCQDUO spectrometer.

NMR data were collected on a Bruker AC 300 Spectrometer. ^{1}H-NMR (300 MHz, $CDCl_3$) δ: 1.47 (3*H*, t, J = 6.7 Hz), 1.68 (2*H*, m), 1.85 (2*H*, m), 2.23 (2*H*, m), 3.04 (4*H*, t, J = 7.9 Hz), 3.13 (2*H*, t, J = 7.3 Hz), 4.10 (2*H*, t, 6.7 Hz), 4.15 (2*H*, q, J = 6.7 Hz), 6.90 (1*H*, d, J = 2.4 Hz), 7.23 (1*H*, dd, J = 9.2 Hz and 2,4 Hz), 7.83 (1*H*, d, 9.2 Hz), 13.6 (1*H*, brs). ^{13}C-NMR (75 MHz, $CDCl_3$) δ: 14.9, 24.0, 25.0, 25.9, 31.4, 31.5, 35.0, 63.8, 103.0, 121.1, 125.9, 129.2, 136.0, 141.6, 149.7, 155.9, 156.6. 162.3.

Refinement

H atoms on C were placed in idealized positions with C—H distances 0.95 - 1.00 Å and thereafter treated as riding. The OH H atom was located from a difference map in the expected circle. Torsional parameters were refined for the methyl and hydroperoxy OH groups. U_{iso} for H were assigned as 1.2 times U_{eq} of the attached atoms (1.5 for methyl and OH).

Figures

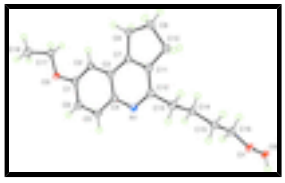

Fig. 1. Ellipsoids at the 50% level, with H atoms having arbitrary radius.

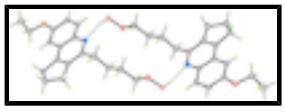

Fig. 2. The hydrogen-bonded dimer, with graph set $R^2_2(18)$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

Received 7 June 2010; accepted 21 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.032; wR factor = 0.078; data-to-parameter ratio = 7.5.

The asymmetric unit of the title compound, $C_{17}H_{17}NO_2$, contains two crystallographically independent molecules. Both molecules adopt a *trans* configuration about the C=C bond, with the C—C=C—C fragments in the two molecules twisted in opposite directions [torsion angles of 174.2 (2) and −175.8 (2)°]. The two benzene rings in each of the molecules make dihedral angles of 20.21 (6) and 48.64 (4)°. In the crystal, adjacent molecules are linked by O—H···O hydrogen bonds into infinite polymeric chains.

(3*E*)-3-[4-(Dimethylamino)phenyl]-1-(4-hydroxyphenyl)prop-2-en-1-one

A. Hasan, N. Akhtar, N. H. Lajis, A. F. B. Rusli and K. M. Lo

Comment

Chalcone is a unique template that is associated with several biological activities. The radical quenching properties of the phenolic groups present in many chalcones have raised interest in using the compounds or chalcone rich plant extracts as drugs or food preservatives [Sortino, *et al.* (2007); Katsori, *et al.* (2009)]. Chalcones constitute an important group of natural product and serve as precursors for the synthesis of different classes of flavonoids, which are common substances in plants [Avila, *et al.* (2008)]. We report here a substituted chalcone derivative which is prepared from the condensation reaction of *p*-hydroxylacetophenone with 4-(*N,N*-dimethylamino)benzaldehyde. The crystal structure of this compound (common chemical name: 4-hydroxy-4'-dimethylaminochalcone) consists of two independent molecules which form polymeric chains as a result of intermolecular hydrogen bonding between the hydroxyl groups and carbonyl oxygen atoms of adjacent molecules (Fig. 2). In contrast, the related compounds, 2-hydroxy-4'-dimethylaminochalcone [Liu, *et al.* (2002)] and 2,4-dihydroxychalcone [Fronczek, *et al.* (1987)] are discrete molecules. In the title compound, the two asymmetric molecules adopt the *trans* configuration about the olefinic double bond with torsional angles of 174.2 (2)° and -175.8 (2)^{o} . In addition, the two benzene rings in both molecules are not co-planar, but makes a dihedral angle of 20.21 (6)° and 48.64 (4)°, respectively.

Experimental

To a stirred solution of KOH (2.0 g, 45.6 mmol) in distilled water (2 ml) cooled in an ice bath, was added 10 ml of methanoic solution containing *p*-hydroxyacetophenone (g, 1 mmol) and 4-(*N,N*-dimethylamino)benzaldehyde (g, 1 mmol). The reaction mixture was stirred at room temperature for 24 h. The mixture was poured into ice-water (10 ml), adjusted to pH 5 - 6 with 1*M* HCl, and then extracted with ethyl acetate. The organic layer was successively washed with distilled water and saturated brine, dried over anhydrous sodium sulfate. The resulting filtrate was evaporated slowly at room temperature to obtain the yellow crystals.

Refinement

Hydrogen atoms were placed at calculated positions (C–H 0.93 Å; O–H 0.82 Å) and were treated as riding on their parent atoms, with *U*(H) set to 1.2–1.5 times *U*~eq~(C). The absolute structure could not be determined from the X-ray analysis. 2266 Friedel pairs were therefore merged before the final refinement.

Figures

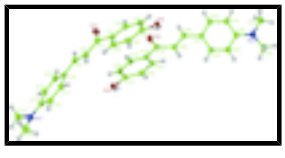

Fig. 1. The molecular structure of 3*E*-(4-dimethylaminophenyl)-1-(4'-hydroxyphenyl)-prop-2-en-1-one showing 70% probability displacement ellipsoids and the atom numbering. Hydrogen atoms are drawn as spheres of arbitrary radius.

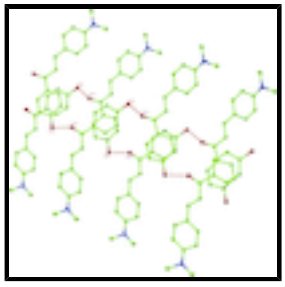

Fig. 2. Crystal packing showing the hydrogen bonding interactions in the molecules.

Hall symbol: P 2yb	Cell parameters from 4618 reflections
$a = 6.3070$ (1) Å	$\theta = 2.8–29.5°$
$b = 29.5285$ (6) Å	$\mu = 0.09$ mm^{-1}
$c = 7.3880$ (2) Å	$T = 100$ K
$\beta = 95.056$ (1)°	Block, yellow
$V = 1370.56$ (5) Å^3	0.48 × 0.24 × 0.16 mm
$Z = 4$	

Data collection

Bruker APEXII CCD area-detector diffractometer	2756 independent reflections
Radiation source: fine-focus sealed tube	2646 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.020$
ω scans	$\theta_{max} = 26.0°$, $\theta_{min} = 1.4°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 2008a)	$h = -7\rightarrow7$
$T_{min} = 0.960$, $T_{max} = 0.987$	$k = -35\rightarrow36$
8837 measured reflections	$l = -9\rightarrow8$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.032$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.078$	H-atom parameters constrained
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0389P)^2 + 0.282P]$ where $P = (F_o^2 + 2F_c^2)/3$
2756 reflections	$(\Delta/\sigma)_{max} = 0.044$

367 parameters	$\Delta\rho_{max} = 0.17$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.26$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 8 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.007 Å; R factor = 0.062; wR factor = 0.151; data-to-parameter ratio = 27.0.

The title compound {systematic name: (1*R*,4*S*,4a*S*,7*R*,8a*R*)-4-bromo-7-[(1*S*,3*R*)-3-bromo-1,2,2-trimethylcyclopentyl]-1,4a-dimethyldecahydronaphthalene-1,7,8a-triol}, $C_{20}H_{34}Br_2O_3$, is a neoirieane-type bromoditerpenoid isolated from *Laurencia yonaguniensis* Masuda et Abe, species inedita. The absolute stereochemistry was established as (1*S*,4*R*,5*R*,7*R*,10*S*,11*S*,14*R*). The structure displays inter- and intramolecular O—H···O hydrogen bonding.

Related literature

Neoirietriol

H. Takahashi, Y. Takahashi, M. Suzuki, T. Abe and M. Masuda

Comment

As part of our continuing chemotaxonomical studies on Japanese species of the red algal genus *Laurencia* (Rhodomelaceae, Ceramiales), we reported previously the structure of neoirietetraol (Takahashi *et al.*, 2002, Takahashi *et al.*, 2007), including the relative configuration and X-ray crystal structure, isolated from *Laurencia yonaguniensis* Masuda et Abe, species inedita (Masuda, *M.*; unpublished results), which was collected at Yonaguni Island, Okinawa, Japan. Further investigation of the related metabolites from this alga has led to the isolation of a new bromoditerpene, named neoirietriol, having a molecular formula of $C_{20}H_{34}Br_2O_3$, which was established by FD-LRMS (m/*z* 466, 464, 462 (1:2:1); M–H_2O) and FAB-HRMS (m/*z* 479.0813; calcd for $C_{20}H_{33}{}^{79}Br_2O_3$, 479.0796; M–H).

During the course of refinement of the structure, the Flack parameter converged to a value of -0.014 (12) within the derived limits as required for the correct enantiomorph of the structure. The absolute configuration of the title compound was established as (1*S*, 4*R*, 5*R*, 7*S*, 10*R*, 11*S*, 14*R*) (Fig. 1).

In the crystal, an intramolecular hydrogen bond was observed between O3···O2[distance 2.691 (4) Å] and an intermolecular hydrogen bond between O1···O3 (*x* + 1, *y*, *z*; distance 2.797 (4) Å) forming an infinite chain structure along the *a* axis (Fig. 2).

Experimental

Isolation

The partially dried alga (40 g) was soaked in MeOH for 3 days. The MeOH solution was concentrated in *vacuo* and partitioned between Et_2O and H_2O. The Et_2O solution was washed with water, dried over anhydrous Na_2SO_4, and evaporated to leave a dark-green oil (523 mg). The extract was fractionated by column chromatography on Si gel with a step gradient (hexane and ethyl acetate). The fraction (144 mg) eluted with hexane-EtOAc (3:1) was further subjected to preparative TLC with toluene-EtOAc (4:1) gave neoiretriol (40.8 mg, 7.8% based on the weight of MeOH extract).

Neoirietriol: mp 132–133 ^{o}C (from CH_2Cl_2/hexane (2:1)); $[a]_D{}^{28}$ -61^{-} (c 0.53; $CHCl_3$); ^{1}H NMR (400 MHz; C_6D_6), d 0.28 (1*H*, br s, OH: D_2O exchangeable), 0.50 (3*H*, s, H_3-18), 0.54 (1*H*, m, Ha-8), 0.60 (1*H*, ddd, *J* = 13.2, 10.3, 5.4 Hz, Ha-12), 0.75 (1*H*, d, *J* = 2.4 Hz, OH: D_2O exchangeable), 0.93 (1*H*, ddd, *J* = 13.7, 4.9, 2.4 Hz, Ha-3), 0.97 (3*H*, s, H_3-20), 1.20 (3*H*, s, H_3-19), 1.38 (3*H*, s, H_3-17), 1.21 (1*H*, ddd, *J* = 13.2, 13.2, 4.4 Hz, Hb-12), 1.56 (1*H*, m, Ha-9), 1.67 (1*H*, ddd, *J* = 13.2, 13.2, 3.9 Hz, Hb-8), 1.76 (1*H*, dd, *J* = 14.2, 2.4 Hz, Ha-6), 1.83 (1*H*, m, Hb-9), 1.86 (1*H*, m, Ha-13), 1.95 (1*H*, ddd, ddd, *J* = 13.7, 9.3, 4.9 Hz, Hb-13), 2.03 (1*H*, m, Ha-2), 2.13 (1*H*, ddd, *J* = 13.7, 13.7, 4.9 Hz, Hb-3), 2.07 (1*H*, dd, *J* = 14.2, 2.4 Hz, Hb-6), 2.48 (1*H*, dddd, *J* = 13.8, 13.2, 12.7, 4.4 Hz, Hb-2), 4.01 (1*H*, dd, *J* = 10.3, 8.8 Hz, H14), 4.88 (1*H*, dd, *J* = 12.7, 4.4 Hz, H-1), 5.20 (1*H*, s, OH: D_2O exchangeable); ^{13}C NMR (100 MHz, DEPT; C_6D_6) d 18.8 (C, C17), 23.4 (CH_3, C18), 23.5 (CH_3, C19), 23.7 (CH_3, C20), 26.7 (CH_3, C16), 30.3 (CH_2 *x* 2, C8 and C12), 31.4 (CH_2, C2), 32.2 (C,

C9), 31.6 (CH_2, C13), 31.7 (CH_2, C6), 32.2 (CH_2, C2), 38.3 (CH_2, C3), 43.7 (C, C10), 48.5 (C, C15), 51.8 (C, C11), 65.2 (CH, C14), 65.7 (CH, C1), 75.3 (C, C4), 78.5 (C, C5), 81.7 (C, C7).

Refinement

Refinement was performed using all reflections. The weighted *R*-factor (*wR*) and goodness of fit (*S*) are based on F^2. *R*-factor (gt) are based on *F*. The threshold expression of $F^2 > 2.0\ \sigma(F^2)$ is used only for calculating *R*-factor (gt). Non-H atoms were refined anisotropically. H atoms were treated as riding models.

Figures

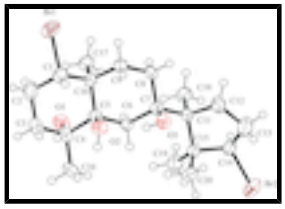

Fig. 1. The structure of the title compound with ellipsoids at the 50% probability level and the atom numbering scheme.

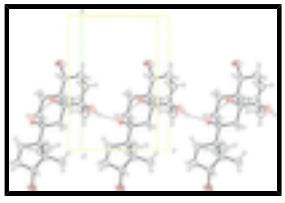

Fig. 2. The packing diagram of the title compound. Inter and intramolecular hydrogen bonds are shown as dashed line.

(1*R*,4*S*,4a*S*,7*R*,8a*R*)-4-bromo-7- [(1*S*,3*R*)-3-bromo-1,2,2-trimethylcyclopentyl]-1,4a- dimethyldecahydronaphthalene-1,7,8a-triol

Crystal data

$C_{20}H_{34}Br_2O_3$	$F(000) = 496.00$
$M_r = 482.29$	$D_x = 1.547$ Mg m^{-3}
Monoclinic, $P2_1$	Mo $K\alpha$ radiation, $\lambda = 0.71069$ Å
Hall symbol: P 2yb	Cell parameters from 1225 reflections
$a = 7.5026\ (2)$ Å	$\theta = 1.8–28.1°$
$b = 11.3985\ (3)$ Å	$\mu = 3.94$ mm^{-1}
$c = 12.1498\ (5)$ Å	$T = 296$ K
$\beta = 94.9780\ (3)°$	Prism, colorless
$V = 1035.11\ (6)$ Å^3	0.30 × 0.20 × 0.20 mm
$Z = 2$	

Data collection

Nonius KappaCCD diffractometer	6129 independent reflections
Radiation source: Mo Kα	4774 reflections with $F^2 > 2\sigma(F^2)$
horizonally mounted graphite crystal	$R_{int} = 0.110$

Detector resolution: 9 pixels mm^{-1}
ω scans
Absorption correction: multi-scan (*DENZO-SMN*; Otwinowski & Minor, 1997)
T_{min} = 0.402, T_{max} = 0.454
43586 measured reflections

θ_{max} = 30.5°
h = −10→10
k = −16→16
l = −17→17

Refinement

Refinement on F^2
$R[F^2 > 2\sigma(F^2)]$ = 0.062
$wR(F^2)$ = 0.151
S = 1.14
6129 reflections
227 parameters
All H-atom parameters refined

$w = 1/[\sigma^2(F_o^2) + (0.0612P)^2 + 1.0272P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$
$\Delta\rho_{max}$ = 0.66 e $Å^{-3}$
$\Delta\rho_{min}$ = −0.44 e $Å^{-3}$
Absolute structure: Flack (1983)
Flack parameter: −0.014 (12)

Special details

Refinement. Refinement was performed using all reflections. The weighted *R*-factor (*wR*) and goodness of fit (*S*) are based on F^2. *R*-factor (gt) are based on *F*. The threshold expression of $F^2 > 2.0\ \sigma\ (F^2)$ is used only for calculating *R*-factor (gt).

Received 9 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 110 K; mean σ(C–C) = 0.003 Å; R factor = 0.039; wR factor = 0.112; data-to-parameter ratio = 15.6.

In the chalcone title compound, $C_{18}H_{17}BrO_4$, the dihedral angle between the mean planes of the 2-bromo- and 3,4,5-trimethoxy-substituted benzene rings is 89.3 (1)°. The angles between the mean plane of the prop-2-en-1-one group and the 2-bromophenyl and 3,4,5-trimethoxyphenyl ring planes are 59.7 (1) and 40.5 (8)°, respectively. While no classical hydrogen bonds are present, three weak intermolecular C—H···O interactions and weak C—H···Br and C—H···*Cg* π-ring stacking interactions [C—H···*Cg* distance = 3.377 (2) Å] are observed, which contribute to the stability of crystal packing.

Related literature

For the radical quenching properties of included phenol groups, see: Dhar (1981). For the anticancer activity of chalcones, see: Dimmock *et al.* (1999). For related structures, see: Chantrapromma *et al.* (2009); Patil *et al.* (2006); Suwunwong *et al.* (2009). For bond distances and angles, see: Allen (2002).

(2*E*)-1-(2-Bromophenyl)-3-(3,4,5-trimethoxyphenyl)prop-2-en-1-one

J. P. Jasinski, R. J. Butcher, K. Veena, B. Narayana and H. S. Yathirajan

Comment

Chalcones, or 1,3-diaryl-2-propen-1-ones, belong to the flavonoid family. Chemically they consist of open-chain flavonoids in which the two aromatic rings are joined by a three-carbon α,β-unsaturated carbonyl system. A vast number of naturally occurring chalcones are polyhydroxylated in the aryl rings. The radical quenching properties of the phenol groups present in many chalcones have raised interest in using the compounds or chalcone rich plant extracts as drugs or food preservatives (Dhar, 1981). Chalcones have been reported to possess many useful biological properties, including anti-inflammatory,antimicrobial, antifungal, antioxidant, cytotoxic, anticancer activities (Dimmock *et al.*, 1999). The crystal structures of some closely related chalcones, *viz*., (*E*)-1-(4-bromophenyl)-3-(3,4,5-trimethoxy-phenyl)prop-2-en-1-one (Suwunwong *et al.*, 2009), (*E*)-1-(4-bromophenyl)-3-(2,4,6-trimethoxyphenyl)prop-2-en-1-one (Chantrapromma *et al.*, 2009) and 1-(4-bromophenyl)-3-(2,4,5-trimethoxyphenyl)prop-2-en-1-one (Patil *et al.*, 2006) have been reported. Hence in continuation with the synthesis and crystal structure determination and also owing to the importance of these flavanoid analogs, this new bromo-trimethoxy substituted chalcone, (I), $C_{18}H_{17}BrO_4$, is synthesized and its crystal structure is reported.

The title compound, (I), $C_{18}H_{17}BrO_4$,is a chalcone with 2-bromophenyl and 3,4,5-trimethoxyphenyl rings bonded at opposite sides of a propene group (Fig. 2). The dihedral angle between mean planes of the benzene rings in the *ortho*-bromo and *meta*- *para*-trimethoxy substituted rings is 89.3 (1)°. The angles between the mean plane of the prop-2-ene-1-one group (C1/C7/O1/C8) and the mean planes of the benzene rings in the 2-bromophenyl (C1–C6)and 3,4,5-trimethoxyphenyl rings (C10—C15) are 59.7 (1)° and 40.5 (8)°, respectively. Bond distances and angles are in normal ranges (Allen, 2002). While no classical hydrogen bonds are present, three weak intermolecular C—H···O interactions (Fig. 3) and weak C—H···Br (Table 1) and C17—H17A···*Cg*2 π-ring stacking interactions (H17A···*Cg*2 = 2.83 Å; H17A–Perp = 2.82 Å; C17—H17A···*Cg*2 = 125°; C17···*Cg*2—H17A = 3.379 (2) Å; *Cg*2 = C10–C15) are observed which contribute to the stability of crystal packing.

Experimental

A 50% KOH solution was added to a mixture of 2-bromo acetophenone (0.01 mol, 1.99 g) and 3,4,5-trimethoxy benzaldehyde (0.01 mol, 1.96 g) in 25 ml of ethanol (Fig. 1). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. The single-crystal was grown from ethyl acetate by slow evaporation method and yield of the compound was 45% (m.p.325–327 K). Analytical data: Found (Calculated) for $C_{18}H_{17}BrO_4$: C %: 57.26 (57.31%); H%: 4.49 (4.54%).

Refinement

The H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C–H distances = 0.95–0.96Å and with U_{iso}(H) = 1.18–1.50 U_{eq}(C).

Figures

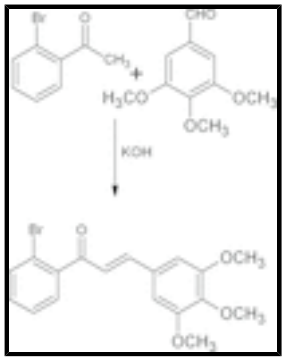

Fig. 1. Reaction Scheme for the title compound.

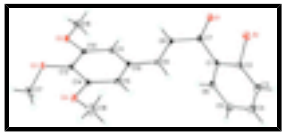

Fig. 2. Molecular structure of (I), $C_{18}H_{17}BrO_4$, showing the atom labeling scheme and 50% probability displacement ellipsoids.

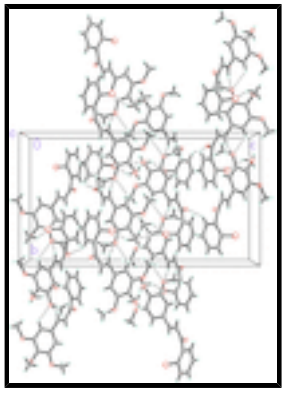

Fig. 3. Packing diagram of the title compound, $C_{18}H_{17}BrO_4$, viewed down the *a* axis. Dashed lines indicate weak C—H···O intermolecular hydrogen bond interactions linking the molecules into chains along the (011).

Special details

Experimental. IR data (KBr) \v cm^{-1}: 2998 cm^{-1}, 2937 cm^{-1}, 2839 cm^{-1} (C—H al. str), 3058 cm^{-1} (C—H ar.str) 1646 cm^{-1} (C=O), 1580 cm^{-1} (C=C); 1245 cm^{-1} (C—O—C).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 18 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 123 K; mean σ(C–C) = 0.004 Å; R factor = 0.064; wR factor = 0.164; data-to-parameter ratio = 13.0.

The title compound, $C_{23}H_{20}O_2$, is a precursor of a pyrene-based supramolecular element for non-covalent attachment to a carbon nanotube. The asymmetric unit contains three independent molecules. The carboxylic acid group in each of these molecules serves as an intermolecular hydrogen-bond donor and acceptor, generating the commonly observed double O—H···O hydrogen-bond motif in an eight-membered ring. Weaker C—H···O, π–π [centroid–centroid distance = 3.968 (4) Å] and C—H···π interactions are also found in the crystal structure.

Related literature

Pyrene functionalized with an aliphatic spacer can be used to functionalize molecular skeletons and the resulting mono- or multipyrene derivative bound non-covalently to a π-surface, see: Kavakka *et al.* (2007); Tomonari *et al.* (2006). For related structures, see: Bariamis *et al.* (2009). For hydrogen-bond motifs, see: Bernstein *et al.* (1995). The title compound was synthesized by a Wittig reaction, see: Wittig & Haag (1955); Wittig & Schöllkopf (1954).

(*E*)-7-(Pyren-1-yl)hept-6-enoic acid

A. Valkonen, T. Lahtinen and K. Rissanen

Comment

Pyrene functionalized with an aliphatic spacer can be used to functionalize molecular skeletons and the resulting mono- or multipyrene derivative bound non-covalently to a pi-surface. Such a non-covalent functionalization has recently been reported by Kavakka *et al.* (Kavakka, *et al.*, 2007) and Tomonari *et al.* (Tomonari, *et al.*, 2006).

The title compound is synthesized by a Wittig reaction (Wittig & Schöllkopf, 1954; Wittig & Haag, 1955). In the molecule (Fig. 1) the planar pyrene ring is bonded to olefinic end carbon of hepten-6-oic acid chain and the pyrene is not coplanar with the conjugated double bond. In three independent molecules in asymmetric unit (labelled *A*, *B* and *C*) the hepten-6-oic acid side chains are almost straight and the dihedral angles between the pyrene rings and the double bonds are 34.8 (3), 14.5 (5) and 33.7 (2) °, respectively. Similar phenomenon was observed with (2*E*,4*E*,6*E*)-3-Methyl-7-(pyren-1-yl)octa-2,4,6-trienoic acid (Bariamis, *et al.*, 2009), the trienoic acid derivative with two additional methyl groups in the positions of 3 and 7 in the side chain. Similar to that trienoic acid (Bariamis, *et al.*, 2009) the carboxyl groups of three molecules of the title compound are connected to carboxyl group of another molecule with double hydrogen bonding interactions (Table 1), generating the $R^2_2(8)$ graph-set motif (Bernstein *et al.*, 1995). With this motif one centrosymmetric *BB* pair and two non-centrosymmetric *AC* pairs were formed (Fig. 2). Mercury -program (Macrae *et al.*, 2008) also finds some short intermolecular C—H···O, π–π [centroid-centroid distance 3.968 (4) Å] and weak C—H···π contacts (Table 1), which connect these pairs to each other and define the overall structure in the crystal.

Experimental

Bis(trimethylsilyl)amine (HMDS) (526 mg, 3.28 mmol) was dissolved in dry THF under inert atmosphere. 1.6-*M* n-BuLi (6.15 ml) was added at -10 °C temperature and the resulting solution was placed into dropping funnel and kept under inert atmosphere. (5-Carboxypentyl)triphenylphosphonium bromide (1.5 g, 3.28 mmol) was dissolved in dry THF under inert atmosphere. The solution was cooled to -10 °C and LiHMDS was added dropwise to the reaction flask. After addition the reaction mixture was stirred at room temperature for 20 minutes. Then the reaction mixture was cooled again (ice salt bath) and 1-pyrene carboxaldehyde (755 mg, 3.28 mmol), dissolved in dry THF, was added dropwise into reaction mixture under inert atmosphere. After addition the reaction mixture was stirred at room temperature for 1 h. The reaction was quenched with aq. 5% citric acid, extracted with DCM and obtained extract was evaporated to yield brown oil. Brown plates were crystallized out from this oil within two weeks. These plates were directly used in single-crystal analysis.

Refinement

All H atoms were visible in electron density maps, but those bonded to C were calculated at their idealized positions and allowed to ride on their parent atoms at C—H distances of 0.95 Å (aromatic, olefinic) and 0.99 Å (methylene), with U_{iso}(H) of 1.2 times U_{eq}(C). The O—H protons were found in the electron density map and were fixed in place by *DFIX* restraint (s = 0.02) at distances of 0.91 Å from N atoms, and U_{iso}(H) values of 1.5 times U_{eq}(O) were used.

Figures

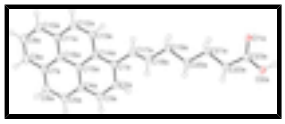

Fig. 1. View of the molecule *A* of title compound showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented by circles of arbitrary size.

Fig. 2. Packing diagram of the title compound showing the *AC* and *BB* pairs formed by O—H···O interactions between carboxyl groups.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.064$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.164$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.051P)^2 + 2.3851P]$ where $P = (F_o^2 + 2F_c^2)/3$
8885 reflections	$(\Delta/\sigma)_{max} < 0.001$

685 parameters

9 restraints

$\Delta\rho_{max} = 0.32$ e Å^{-3}

$\Delta\rho_{min} = -0.39$ e Å^{-3}

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 3 June 2010; accepted 22 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.016; wR factor = 0.034; data-to-parameter ratio = 25.9.

The title compound, $C_{14}H_{12}Br_4$, crystallizes with imposed inversion symmetry. In the crystal, the molecules pack in layers parallel to (10$\bar{1}$). The layers involve two Br···Br and one H···Br contact. Between the layers, one contact each of types Br···Br, H···Br and Br···π is observed.

Related literature

For the use of 2,3,6,7-tetrakis(bromomethyl)naphthalene in the preparation of cyclophanes, see: Otsubo *et al.* (1983, 1989); Yano *et al.* (1999); Skibiński *et al.* (2009). For its applications in the synthesis of hydrogen-bonded molecular capsules, see: Valdes *et al.* (1995); Rivera *et al.* (2001). For reviews on halogen–halogen contacts and 'weak' hydrogen bonding, see: Desiraju & Steiner (1999); Metrangolo & Resnati (2001); Metrangolo *et al.* (2008); Rissanen (2008). For the X-ray structures of the full series of ten isomeric bis(bromomethyl)naphthalenes, see: Jones & Kuś (2010). For the X-ray structures of two isomeric tetrakis(bromomethyl)benzene derivatives, see: Jones & Kuś (2007).

2,3,6,7-Tetrakis(bromomethyl)naphthalene

M. Skibinski, V. A. Azov and P. G. Jones

Comment

The title compound is a symmetric rigid molecule with four bromomethyl groups. The bromine atoms can be easily substituted by other nucleophiles, which offers the opportunity of employing the compound as a building block for construction of various functional architectures. The title compound was prepared to serve as a spacer between two tetrathiafulvalene (TTF) groups in TTF-containing molecular tweezers (Skibiński *et al.*, 2009). It was first employed as an intermediate in the preparation of triple-layered [2.2]naphthalenophane (Otsubo *et al.*, 1983), and several other triple-layered cyclophanes (Otsubo *et al.*, 1983; Yano *et al.*, 1999). It was also used as an intermediate in the synthesis of H-bonded molecular capsules (Valdes *et al.*, 1995; Rivera *et al.*, 2001).

The molecule of the title compound is shown in Fig. 1. It displays crystallographic inversion symmetry (operator #1 - *x*, 1 - *y*, 1 - *z*); for this reason, the crystallographic numbering does not correspond to the IUPAC numbering scheme. Bond lengths and angles may be considered normal; the bromine atoms are directed to opposite sides of the ring system, with C(2)—C(3)—C(6)—Br(1) 92.22 (16), C(3)—C(4)—C(7)—Br2 - 79.86 (17)°, which leads to a +/-/-/+ pattern of Br atoms about the ring plane for the IUPAC-numbered C2,3,6,7; this contrasts with the -/-/+/+ pattern in 1,2,4,5-tetrakis(bromomethyl)benzene (Jones & Kuś, 2007), which is also inversion-symmetric.

Details of the packing interactions are given in the Tables. The molecules pack in layers parallel to (10$\bar{1}$). Within the layers, the contacts Br1···Br2, the longer Br2···Br2 and the shorter H6A···Br2 are observed. These combine to form columns of interactions parallel to the *b* axis; chains of molecules parallel to [101] (horizontal in Fig. 2) are also formed. The contacts Br2···Br2 (the shorter), H6A···Br2 (the longer) and Br1···*Cg* (*Cg* = centre of gravity of the ring C1–5 and C1#1) link the layers (Fig. 3). H5···Br1 3.11 Å between the layers is a borderline interaction. The Br···*Cg* interaction could alternatively be interpreted as Br···C5, which at 3.450 (2) Å is by far the shortest of the six Br···C contacts; it is often unclear which is the better interpretation in such systems (Jones & Kuś, 2010). Despite the presence of the naphthalene ring systems, there are no significant *Cg*···*Cg* interactions. The shortest H···*Cg* contact is H7A···*Cg* (1 - *x*,1 - *y*,-*z*) 3.10 Å between layers, but this is both long and has a narrow angle (124°). We can conclude that the crystal packing of the title compound is dominated by the contacts involving bromomethylene groups.

Experimental

The title compound was prepared as described by Rivera *et al.* (2001) by treatment of a solution of 2,3-bis[{[(1,1-dimethylethyl)dimethylsilyl]oxy}methyl]- 6,7-bis[(phenylmethoxy)methyl]-naphthalene in chloroform with gaseous HBr. The compound was obtained as a colourless microcrystalline solid. Yield: 87%. Crystals suitable for X-ray diffraction were grown by slow evaporation of a solution in EtOH/hexane/CH_2Cl_2. *M*.p. (decomp.) 230–231° C (lit. 230° C). ^{1}H NMR ($CDCl_3$): δ = 7.83 (s, 4H), 4.84 (s, 8H) p.p.m..

The title compound is poorly soluble (< 1 g/*L*) in most organic solvents at room temperature, but is much more soluble in aromatic solvents, such as toluene or chlorobenzene, upon reflux.

Refinement

Hydrogen atoms were included at calculated positions using a riding model with aromatic C—H 0.95, methylene C—H 0.99 Å. The U(H) values were fixed at 1.2 × U_{eq}(C) of the parent C atom.

Figures

Fig. 1. Structure of the title compound in the crystal. Ellipsoids represent 50% probability levels. Only the asymmetric unit is numbered.

Fig. 2. Molecular packing of the title compound as a layer parallel to (10$\bar{1}$). Br···Br and H···Br contacts are shown as thick dashed bonds.

Fig. 3. Linking between the layers of the title compound. Br···Br and H···Br contacts are shown as thick dashed bonds. One representative Br···*Cg* contact is shown as a thin dashed bond (top left).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 January 2010; accepted 18 May 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.002 Å; R factor = 0.037; wR factor = 0.110; data-to-parameter ratio = 14.1.

The title compound, $C_{18}H_{19}NO_4$, was prepared as an indole derivative with possible antimitotic properties. The planes of the indole and trimethoxyphenyl rings make a dihedral angle of 45.35 (5)° with one another. In the crystal, molecules related by a twofold screw axis exhibit arene C—H···arene-π interactions which are 3.035 (1) Å in length.

Comment

The indole core is a common structure observed in a wide variety of biologically active compounds and pharmaceutical products (Li & Martins, 2003). Indole structures are considered as privileged structure motifs, due to their ability to bind many receptors within the body (Fuwa & Sasaki, 2009). As a result, there has been a great deal of research dedicated to incorporating the indole functionality in the design and synthesis of novel anti-mitotic compounds for the treatment of cancer. The title compound was prepared as an indole derivative with possible anti-mitotic properties.

The structure of the title compound is shown in Fig. 1. The plane of the indole ring and the plane of the trimethoxyphenyl ring make a 45.35 (5)° angle with one another. The deviation of methoxy carbon C19 from the indole mean plane is 0.050 (3) Å. The deviations of methoxy carbons C16, C17, and C18 from the plane of the phenyl ring are 0.065 (3) Å, 1.157 (3) Å, and 0.138 (3) Å, respectively. Molecules related by a two-fold screw axis exhibit arene C—H··· arene π interactions, as shown in Fig. 2. The interaction is between C4—H of one molecule and the six membered (C4 through C9) aromatic ring of the screw-related molecule. The H··· ring-centroid distance is 3.035 (1) Å, and the H··· ring-centroid line makes an angle of 5.6 (3)° with the normal to the plane of the ring.

In a comparable structure, 1-(3,4,5-Trimethoxyphenyl)naphthalene (Suthar *et al.*, 2005), the angle between the planes of the napthylene ring and the trimethoxyphenyl ring is 68.19 (10)°.

Experimental

Preparation of the title compound (III) (See Synthesis scheme): To a Schlenk flask equipped with a magnetic stir bar, 1.47 g (10 mmol) of 5-methoxyindole (II), 6.36 g (30 mmol) of K_3PO_4, and 0.190 g (10 mol %) of CuI were added. The reaction flask was then purged with nitrogen gas and charged with 2.94 g (10 mmol) of 5-iodo-1,2,3-trimethoxybenzene (I), 0.22 ml (20 mol %) of *N*,*N*'-dimethylethylenediamine, and 25.0 ml of dry degassed toluene. The reaction mixture was heated to reflux for 24 hours. Upon completion, the crude reaction mixture was filtered through a celite plug, and concentrated on a rotary evaporator to yield an off-white solid. The solid was recrystallized from ethanol to obtain the x-ray quality crystals. Pure product was obtained in 86 % yield (2.70 g). Melting point: 99-101°C. MS(E1): M+ 313 m/z, 298 m/z. 1H NMR (300 MHz, DMSO-d) δ7.62 (d, 1H), 7.56 (d,1*H*), 7.14 (d,1*H*), 6.84(d,1*H*), 6.82 (s, 2H), 6.58 (d, 1H), 3.85 (s,6*H*), 3.78 (s, 3H), 3.71 (s,3*H*)

Refinement

All H atoms were constrained using a riding model. The aromatic C—H bond lengths were fixed at 0.93 Å, with U_{iso}(H) = 1.2 U_{eq}(C). The methyl C—H bond lengths were fixed at 0.96 Å, with U_{iso}(H) = 1.5 U_{eq}(C). An idealized tetrahedral geometry was used for the methyl groups, and the torsion angles around the O—C bonds were refined.

Extinction correction: *SHELXL97* (Sheldrick, 2008),
$Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$

Extinction coefficient: 0.00188 (13)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.004 Å; R factor = 0.056; wR factor = 0.162; data-to-parameter ratio = 16.9.

The title compound, $C_{36}H_{34}N_4O_4S_2$, is a thioglycoluril derivative, which bears two phenyl substituents on its convex face and two methoxy substituted *o*-xylylenes as sidewalls of the molecular clip. There is one half-molecule in the asymmetric unit: a crystallographic twofold axis generates the complete molecule. The non-planar seven-membered rings adopt chair conformations, while the two five-membered rings exhibit envelope conformations and make a dihedral angle of 68.46 (12)°. The O atoms of the methoxy groups are coplanar with the six-membered *o*-xylylene sidewalls.

Comment

The rigid concave shape of glycoluril makes it a versatile building block to construct various supramolecular objects (Gao *et al.*, 2009), including molecular clips and molecular baskets (Rowan *et al.*, 1999), molecular capsules (Hof *et al.*, 2002), xerogels (Kolbel & Menger, 2001), the cucurbit[n]uril family (Wu *et al.*, 2002), and anion-binding receptors (Kang *et al.*, 2004). Based on the previous studies (Broan *et al.*, 1989; Cao *et al.*, 2009; Wang *et al.*, 2006; Wang & Xi, 2009; Wu & Sun, 2009), we report here the structure of the title thioglycoluril derivative (Fig. 1), which is a potential receptor in supramolecular chemistry.

There is one half-molecule in the asymmetric unit. The non-planar seven-membered rings adopt chair conformations, while the two five-membered rings have envelope conformation and the dihedral angle between them is 68.46°. The methoxy groups on sidewalls are coplanar with the six-membered o-xylylene sidewalls. The molecule contains three nonclassical intramolecular C—H···S, C—H···O and C—H···N hydrogen bonds, and its crystal structure is stabilized mostly by intermolecular C—H···π interactions (Table 1).

Experimental

The thioglycoluril was synthesized according to a literature procedure, see : Broan *et al.*, (1989). Preparation of the title compound: A solution of thioglycoluril (326 mg, 1.00 mmol), paraformaldehyde (120 mg, 4.00 mmol) and 1,4-dimethoxybenzene (304 mg, 2.20 mmol) in TFA (5 ml) was stirred and heated at reflux for 6 h. After rotary evaporation the residue was chromatographed to yield the tile compound (521 mg, 0.80 mmol,80%). Crystals of (I) suitable for X-ray diffraction were grown by slow evaporation of a dichloromethane-methanol (1:2) solution of the title compound under 293 K.

Refinement

All H atoms were positioned in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances in the range 0.93-0.98 Å and Uĩso~(H) = 1.2U~eq~(C) or Uĩso~(H) = 1.5U~eq~(C).

Figures

Fig. 1. A view of (I), showing the atom-labelling scheme, with displacement ellipsoids drawn at the 30% probability level.

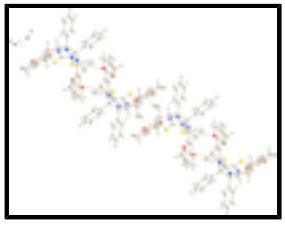

Fig. 2. Packing of (I) with C—H···π interactions drawn as dashed lines showing the formation of a one-dimensional chain.

3,6,14,17-Tetramethoxy-22,23-diphenyl-1,10,12,21-\ tetraazahexacyclo[19.2.1.$0^{2,7}$.$0^{10,23}$.$0^{12,22}$.$0^{13,18}$]tetracosa-\ 2(7),3,5,13 (18),14,16-hexaene-11,24-dithione

Crystal data

$C_{36}H_{34}N_4O_4S_2$	$F(000)$ = 1368

13570 measured reflections	k = −15→15
3546 independent reflections	l = −19→20

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.056$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.162$	H-atom parameters constrained
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0878P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3546 reflections	$(\Delta/\sigma)_{max} = 0.001$
210 parameters	$\Delta\rho_{max} = 0.29$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.24$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Correspondence e-mail: tigerhuo1974@yahoo.com.cn

Received 9 April 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.003 Å; R factor = 0.033; wR factor = 0.111; data-to-parameter ratio = 13.5.

The title compound, $C_{10}H_6ClF_3N_2O_2$, was synthesized by coupling 4-dimethylamino-1,1,1-trifluorobut-3-en-2-one with 4-chlorobenzenediazonium chloride. It crystallizes with two molecules in the asymmetric unit, which form two similar centrosymmetric dimers *via* hydrogen bonds. Extensive electron delocalization and intramolecular N—H···O hydrogen bonds are responsible for a planar conformation of the molecules (maximum deviations = 0.010 and −0.015 Å for the two molecules). In addition to hydrogen bonds, π–π stacking interactions with centroid–centroid distances of 3.604 (2) and 3.583 (2) Å contribute to the stability of the crystal structure.

Related literature

(2*E*)-2-[2-(4-Chlorophenyl)hydrazin-1-ylidene]-4,4,4-trifluoro-3-oxobutanal

Y.-P. Huo and L.-H. Zhou

Comment

Herein, we report the crystal structure of (2*E*)-2-[2-(4-chlorophenyl)]hydrazinylidene]-4,4,4-trifluoro-3-oxobutanal, which was prepared *via* a reaction of 4-(dimethylamino)-1,1,1-trifluorobut-3-en-2-one with diazonium salt according to the procedure reported by Zhu *et al.* (2008). The title compound, **3**, has been characterized by ESI-MS, NMR, FTIR spectroscopy and elemental analysis. Here we report the crystal structure of **3**. It crystallizes with two almost identical molecules in the asymmetric unit. The molecule is almost planar except for the $–CF_3$ group F atoms. There are some supramolecular interactions in the compound **3**. The intramolecular N—H···O hydrogen bonds are N11—H11···O8 and N29—H29···O26 (Table 1) together with strong π-π stacking interactions [centroid-to-centroid distance = 3.604 (2) Å; 3.583 (2) Å] that contribute to the stability of the structure.

Experimental

The title compound was prepared *via* the reaction of 4-(dimethylamino)-1,1,1-trifluorobut-3-en-2-one with diazonium salt according to the procedure reported by Zhu *et al.* (2008). A solution of the *p*-chloroaniline **2** (1.28 g, 10 mmol) in a solution of 3 *M* HCl (5 ml) was diazotized at 0 °C by slow addition of a solution of $NaNO_2$ (0.7 g, 10 mmol) in 5 ml H_2O. The solution of aniline diazonium salt was added dropwise to a mixture of compound **1** (see scheme) (1.67 g, 10 mmol) with NaOH (1.6 g, 40 mmol) and ethanol (50 ml) in ice-salt bath. The reaction mixture was stirred for 1 h at the same temperature, then TLC analysis showed that the reaction had finished. The resulting precipitate was filtered off. Purification by column chromatography on silica gel (hexane:AcOEt = 30:1) gave red solid **3** in 75% yield. mp 418-420 K. ^{1}H NMR ($CDCl_3$, 300 MHz) δ14.87 (1*H*, s, NH), 10.03 (1*H*, s, CHO), 7.45 (4*H*, s, Ph), ^{19}F NMR ($CDCl_3$): -71.50 (3 F, s, CF_3). IR (KBr, cm^{-1}): 2924, 1699, 1526, 1308, 1187, 1157, 897; ESI-MS *m*/*z*: 279.9 ($[M+H]^+$); Elemental analysis: found C: 43.13, H: 2.29, N: 10.07; calculated for ($C_{10}H_6ClF_3N_2O_2$) C: 43.11 H: 2.17 N: 10.05 (%). 20 mg of compound **3** was dissolved in 10 ml (EtOAc:pPetroleum ether = 1:8) and the solution was kept at room temperature for 6 d, natural evaporation gave red single crystals of compound **3** suitable for X-ray analysis.

Refinement

All H atoms were positioned geometrically and refined using a riding model, with all C—H = 0.95 Å, N—H = 0.88 Å and with U_{iso}(H) = 1.2U_{eq}(C), U_{iso}(H) = 1.2U_{eq}(N).

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0688P)^2 + 0.2643P]$ where $P = (F_o^2 + 2F_c^2)/3$
4387 reflections	$(\Delta/\sigma)_{max} = 0.001$
325 parameters	$\Delta\rho_{max} = 0.29$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.23$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 24 May 2010; accepted 1 June 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.002 Å; R factor = 0.034; wR factor = 0.096; data-to-parameter ratio = 13.9.

In the title molecule, $C_{19}H_{14}ClN_3O$, the quinoline and quinazoline ring systems form a dihedral angle of 80.75 (4)°. In the crystal, the molecules are linked by pairs of C—H···N hydrogen bonds into centrosymmetric dimers, generating $R_2^2(6)$ ring motifs. The structure is further stabilized by C—H···π interactions and π–π stacking interactions [centroid–centroid distances = 3.7869 (8) and 3.8490 (8) Å].

3-[(2-Chloro-6-methylquinolin-3-yl)methyl]quinazolin-4(3*H*)-one

S. M. Roopan, F. N. Khan, S. Kone, V. R. Hathwar and M. Akkurt

Comment

Heterocyclic chemistry comprises at least half of all organic chemistry research worldwide (Roopan *et al.*, 2008*a*,b). In particular, heterocyclic structures form the basis of many pharmaceutical, agrochemical and veterinary products. 4(3*H*)-quinazolinones and quinolines (Roopan *et al.*, 2009) are classes of fused heterocycles that are of considerable interest because of their biological properties. Some are endowed with antimicrobial, aniconvulsant, antihistamine and anti-inflammatory properties (Abdel-Hamide *et al.*, 1996, Chapman *et al.*, 1963, Bekhit *et al.*, 1998). On the other hand, some quinoline derivatives also have various biological properties like antioxidant, hemolytic and cytotoxicity. These observations prompted us to synthesized heterocyclic compounds containing a quinolinyl-quinazolinone moiety.

As shown in Fig. 1, the quinoline (N1/C1–C9) and quinazoline (N2/N3/C12–C19) ring systems of the title molecule (I) are almost planar with maximum deviations of -0.016 (1) Å for C2 and 0.065 (1) Å for N2, respectively, and there is a dihedral angle of 80.75 (4)° between them.

Two neighbouring molecules are linked by a pair of C—H···N hydrogen bonds into a pseudo-centrosymmetric dimer, generating an $R^2_2(6)$ ring motif (Table 1, Fig. 2). In addition, the structure is stabilized by C—H···π interactions (Table 1) and π-π stacking interactions [*Cg*1···*Cg*3(2 - *x*,-*y*, 2 - *z*) = 3.7869 (8) Å and *Cg*3···*Cg*3(1 - *x*, -*y*, 2 - *z*) = 3.8490 (8) Å; where *Cg*1 and *Cg*3 are centroids of the N1/C1–C4/C9 and C4–C9 rings, respectively].

Experimental

To a solution of 4(3*H*)-quinazolinone (146 mg, 1 mmol) in 2 ml of DMF were added KOtBu (112 mg, 1 mmol) in 10 ml of THF and 2-chloro-3-(chloromethyl)-6-methylquinoline (225 mg, 1 mmol) and the resulting mixture was refluxed at 343 K for 1 h. After the completion, the reaction was cooled and the excess of solvent removed under reduced pressure. Crushed ice was mixed with the residue. White solid was formed which was purified by column chromatography using hexane and ethylacetate as the eluant. Crystals of suitable quality were grown by solvent evaporation from a solution of the compound in diethyl ether.

Refinement

The H atoms were positioned geometrically with C—H = 0.93, 0.97 and 0.96 Å, for aromatic, methylene and methyl H, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = xU$_{eq}$(C), where x = 1.5 for methyl H, and x = 1.2 for others H atoms.

Figures

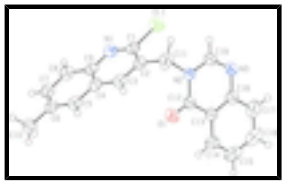

Fig. 1. The molecular structure of the title compound, showing the atom-numbering scheme and displacement ellipsoids drawn at the 50% probability level.

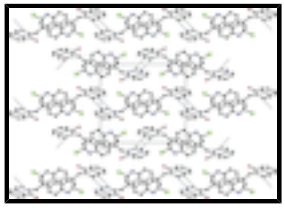

Fig. 2. Crystal packing viewed down *a* axis. H atoms not involved in the intermolecular interactions (dashed lines) have been omitted for clarity.

Crystal data

$C_{19}H_{14}ClN_3O$	$F(000) = 696$
$M_r = 335.78$	$D_x = 1.438$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 1326 reflections
$a = 7.86728$ (14) Å	$\theta = 2.0$–$20.7°$
$b = 14.7098$ (3) Å	$\mu = 0.26$ mm^{-1}
$c = 13.7055$ (3) Å	$T = 295$ K
$\beta = 102.1500$ (17)°	Needle, colourless
$V = 1550.56$ (5) Å^3	0.25 × 0.21 × 0.16 mm
$Z = 4$	

Data collection

Oxford Diffraction Xcalibur E CCD diffractometer	3048 independent reflections
Radiation source: Enhance (Mo) X-ray Source	2417 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.026$
ω scans	$\theta_{max} = 26.0°$, $\theta_{min} = 2.7°$
Absorption correction: multi-scan (*CrysAlis PRO*; Oxford Diffraction, 2009)	$h = -9 \rightarrow 9$
$T_{min} = 0.938$, $T_{max} = 0.960$	$k = -18 \rightarrow 18$
15755 measured reflections	$l = -16 \rightarrow 16$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.034$	H-atom parameters constrained

$wR(F^2) = 0.096$	$w = 1/[\sigma^2(F_o^2) + (0.0511P)^2 + 0.0739P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.14$	$(\Delta/\sigma)_{max} = 0.001$
3048 reflections	$\Delta\rho_{max} = 0.18$ e Å^{-3}
219 parameters	$\Delta\rho_{min} = -0.19$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $FC^*=KFC[1+0.001XFC^2\Lambda^3/SIN(2\Theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0123 (15)

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 25 May 2010; accepted 1 June 2010

Key indicators: single-crystal X-ray study; T = 123 K; mean σ(C–C) = 0.009 Å; disorder in main residue; R factor = 0.068; wR factor = 0.201; data-to-parameter ratio = 14.2.

The title compound, $C_{34}H_{32}O_6S$, is an *ido*-configured thioglycoside building block for heparan sulfate fragments. It contains disordered tolyl and O-benzyl groups with occupancy ratios of 0.539 (13):0.461 (13) and 0.613 (13):0.387 (13), respectively, as determined from a weakly diffracting crystal. The fused rings adopt chair conformations with the molecules packing into a three-dimensional network *via* C—H···O and three C—H···π interactions. The former interactions, occuring between molecules related by a twofold axis, define an $R_2^2(26)$ motif.

p-Tolyl 2-*O*-benzoyl-3-*O*-benzyl-4,6-*O*-benzylidene-1-thio-*α*-L-idopyranoside

G. J. Gainsford, P. C. Tyler and O. V. Zubkova

Comment

Heparan sulfates (HSs), highly sulfated glycosaminoglycans, have emerged as a novel and exciting class of molecules with a huge variety of critical functions in cell signalling and development. HSs are made up of repeating 1,4-linked disaccharide units. These are composed of a hexuronic acid (*ido*- and *gluco*-configured) and an *N*-acetyl or *N*-sulfoglucosamine which bear one or several *O*-sulfate substituents. *Ido*-configured thioglycoside building blocks **2** and **3** (Figure 1) were prepared to be used in our synthesis of defined fragments of HS.

The title compound (**4**, Figure 1), $C_{34}H_{32}O_6S$, crystallizes with one independent molecule in the asymmetric unit (Figure 2). For information, its systematic name is benzoic acid 8-benzyloxy-2-phenyl-6-*p*-tolylsulfanyl -hexahydro-pyrano[3,2-*d*][1,3]dioxin-7-yl ester. The phenyl rings (C14–C19 & C29–C34 plus linked atoms C20, O6 & C25) are disordered between two conformations which are labelled a & b respectively (Figure 3) with the final refined occupancies a:b being 0.539 (13):0.461 (13) and 0.613 (10):0.387 (10) respectively. Note that it was not possible to refine two positions at the C15 & C16 sites so these atoms were given unit occupancies.

The determined absolute configuration with C1(*R*), C4(S), C5(*R*), C6(S), C7(*R*) & C8(*R*) confirms the expected stereochemistry and is different from the diacetate derivative (XAZLUG) with configurations *R*,*R*,*S*,*S*,*R*,*S* respectively (Zhou *et al.*, 2006). The fused rings adopt chair configurations: for O1,C1–C5 the puckering amplitude Q is 0.559 (6) Å, θ 166.6 (6)° and φ 243 (3)° while for O5, C4–C8 the corresponding values are 0.525 (6) Å, 13.9 (7)° and 333 (3)° (Cremer & Pople, 1975).

The molecules pack into a three dimensional network using C—H···O and C–H···π interactions (Table 1) with phenyl, tertiary & methylene carbon donor atoms (Figure 2). The C—H···O interactions form a dimeric $R^2_2(26)$ motif (Bernstein *et al.*, 1995) through O4, between molecules related by the 2-fold rotation axis, and a weaker C(3) link through O1, respectively (Figure 4). The *Cg*1, *Cg*2 & *Cg*3 atom designations in Table 1 are the centroids of phenyl rings (C2,C9–C13), (C14A–C19A) and (C22–C27) respectively. The related diacetate (XUGLAG) packing was reported as two dimensional sheets *via* C–H···O interactions, but these sheets are interconnected *via* at least one C–H···π interaction.

Experimental

(see Figure 1) *p*-Tolyl 2-*O*-benzoyl-3-*O*-benzyl-4,6-*O*-benzyl idene-1-thio-a-L-idopyranoside (**4**) was prepared in 4 steps from the known 1,2,4,6-Tetra-*O*-benzoyl-3-*O*-benzyl-β-L-idopyranoside (Barroca & Jacquinet, 2000). The starting tetrabenzoate (7.45 g, 10.85 mmol) was dissolved in (CH_2Cl_2, hereafter DCM)(50 ml) and treated with thiocresol (2 g, 16.27 mmol) in the presence of boron trifluoride etherate (0.534 ml, 4.34 mmol) at room temperature for 4 h. The solution was diluted with DCM, washed with water and sat. $NaHCO_3$ solution, dried and concentrated. Chromatography (EtOAc: hexanes, 1: 5) furnished the *p*-tolyl-derivative (**1**, 6.1 g, 8.86 mmol) in 82% yield as a clear syrup. Then Zemplen deacetylation (Polat & Wong, 2007) of the tri-benzoate (**1**, 6 g, 8.71 mmol) at room temperature afforded a triol (**2**, 3.1 g, 8.23 mmol) in 95% yield as a syrup. Triol (**2**, 1 g, 2.66 mmol) was dissolved in dry DMF (15 ml) and treated with benzaldehyde dimethylacetal

(1 ml, 6.66 mmol, 2.5 eq.) followed by a catalytic amount (40 mg) of *p*-toluenesulfonic acid. After 1 h at 60°C the solvents were removed *in vacuo* and the residue was purified by flash chromatography on silica gel to give the benzylidene-derivative (**3**)(1.1 g, 2.37 mmol) in 89% yield as a white foam. The benzylidene-derivative (**3**, 1 g, 2.15 mmol) was dissolved in a mixture of dry DCM (10 ml) and dry pyridine (10 ml) and cooled to 0°C. Treatment with benzoyl chloride (0.625 ml, 5.38 mmol) at 0°C rising to room temperature for 12 h was followed by an aqueous work-up. The solution was diluted with DCM, washed with water and sat. $NaHCO_3$ solution, dried and concentrated. Chromatography (EtOAc: hexanes 1: 4) furnished the benzoate (**4**, 1.2 g, 2.11 mmol) in 98% yield as a white foam. Compound **4 (**100 mg) was dissolved in a hot mixture of EtOAc: hexanes (1:10), and the solution was allowed to cool down slowly. Single crystals were collected and dried *in vacuo*.

^{1}H NMR (300 MHz, $CDCl_3$) δ 2.29 (s, 3H), 3.91 (ddd, 1H, $J_{3,4}$ 2.6 Hz, $J_{2,3}$ 2.5 Hz, H-3); 4.12 (dd, 1H, $J_{4,5}$ 1.6 Hz, H-4), 4.34 (dd, 1H, $J_{6a,6\,b}$ 12.3 Hz, H-6a), 4.19 (dd, 1H, H–6 b), 4.51 (ddd, 1H, $J_{5,6a}$ 1.5 Hz, $J_{5,6\,b}$ 2.0 Hz, H-5), 4.71 and 4.95 (2 d, 2H, *J* 11.7 Hz, $PhCH_2$), 5.52 (dd, 1H, $J_{2,4}$ 1.0 Hz, H-2), 5.56 (s, 1H, PhCH), 5.74 (d, 1H, $J_{1,2}$ 1.3 Hz, H-1), 7.07–8.06 (m, 19H, aromatic). ^{13}C NMR (300 MHz, $CDCl_3$) δ 21.4, 51.7, 60.9, 68.3, 70.3, 71.5, 72.8, 73.6, 73.7, 77.0, 77.5, 77.9, 86.7, 101.4, 126.8, 127.6, 128.3, 128.4, 128.6, 128.9, 129.2, 129.9, 130.1, 130.6, 130.9, 131.1, 131.4, 133.2, 133.4, 133.9, 137.5, 137.7, 138.3, 166.1. HRMS calcd for $C_{34}H_{32}O_6S$ $(M+Na)^+$ 591.1817, found 591.1824.

The benzoate (**4**) was converted to the known compound *p*-tolyl 2-*O*-benzoyl-3-*O*-benzyl-1-thio-α-L-idopyranoside (Polat & Wong, 2007). Benzoate (**4**, 200 mg, 352 µmol) was dissolved in 80% AcOH (10 ml) and stirred at 80°C for 16 h. Concentration and chromatography (EtOAc, hexanes 1: 2) afforded the *p*-tolyl 2-*O*-benzoyl-3-*O*-benzyl-1-thio-α-L-idopyranoside (169 mg, 352 µmol) as a white foam. The ^{1}H and ^{13}C spectra and mass spectral analyses of this were in accord with literature data (Polat & Wong, 2007).

Refinement

The methyl H atoms were constrained to an ideal geometry (C—H = 0.98 Å) with U_{iso}(H) = 1.5U_{eq}(C), but were allowed to rotate freely about the adjacent C—C bonds. Hydrogen H31B was fixed in a calculated position in the last cycles of refinement. All other H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H distances of 0.95 (aromatic), 1.00 (tertiary) or 0.99 (methylene) Å with U_{iso}(H) = 1.2U_{eq}(C,*N*). A total of 116 reflections at high theta with negative intensities were clearly outliers (Delta/sigw > 3.5) and were removed from the refinement. One low angle reflection (10,0,0) was also removed as an outlier. A total of 82 reflections out of the 2878 expected within θ 67.7° are therefore not reported. The crystals were poor diffractors but sufficient data was obtained to solve the structure, confirming the absolute configuration.

Figures

Fig. 1. Chemical synthesis steps to the title compound (see text).

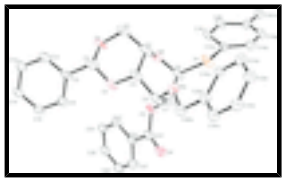

Fig. 2. An *ORTEP* (Farrugia, 1999) view showing the asymmetric unit with 40% probabilility ellipsoids. Only one set (A) of the disordered atoms are shown for clarity.

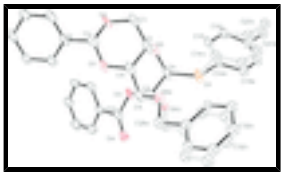

Fig. 3. An *ORTEP* (Farrugia, 1999) view showing the conformational disorder using 40% probabilility ellipsoids. Dotted bonds indicate the minor set (B) atoms; only representattive atoms labels are shown for clarity.

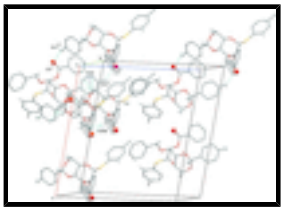

Fig. 4. Mercury cell packing view (Macrae *et al.*, 2006) showing most of the C–H···O and C–H···π interactions (dotted lines, Table 1). All contact atoms are in ball mode with other H atoms omitted for clarity. Symmetry operations: (i) 1/2 - *x*, *y* - 1/2, -*z* (ii) *x* - 1/2, *y* - 1/2, -*z*

p-Tolyl 2-*O*-benzoyl-3-*O*-benzyl- 4,6-*O*-benzylidene-1-thio-α-L-idopyranoside

Crystal data

$C_{34}H_{32}O_6S$	$F(000) = 1200$
$M_r = 568.66$	$D_x = 1.277$ Mg m^{-3}
Monoclinic, *C*2	Cu *K*α radiation, λ = 1.54178 Å
Hall symbol: C 2y	Cell parameters from 1721 reflections
$a = 19.296$ (4) Å	θ = 6.5–66.9°
$b = 8.2060$ (16) Å	μ = 1.34 mm^{-1}
$c = 19.045$ (4) Å	$T = 123$ K
β = 101.27 (3)°	Needle, colourless
$V = 2957.5$ (10) Å^3	0.60 × 0.11 × 0.11 mm
$Z = 4$	

Data collection

Rigaku Spider diffractometer	4882 independent reflections
Radiation source: Rigaku MM007 rotating anode	2352 reflections with $I > 2\sigma(I)$
Rigaku VariMax-HF Confocal Optical System	$R_{int} = 0.052$
Detector resolution: 10 pixels mm^{-1}	$\theta_{max} = 72.2°$, $\theta_{min} = 6.5°$
ω–scans	$h = -22 \rightarrow 23$
Absorption correction: multi-scan (*ABSCOR*; Higashi, 1995)	$k = -9 \rightarrow 8$
$T_{min} = 0.754$, $T_{max} = 1.0$	$l = -17 \rightarrow 23$
10947 measured reflections	

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.068$	$w = 1/[\sigma^2(F_o^2) + (0.0855P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$

$wR(F^2) = 0.201$	$(\Delta/\sigma)_{max} = 0.002$
$S = 1.03$	$\Delta\rho_{max} = 0.28$ e Å^{-3}
4882 reflections	$\Delta\rho_{min} = -0.31$ e Å^{-3}
343 parameters	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
1 restraint	Extinction coefficient: 0.0019 (2)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 1939 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.01 (4)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Dispiro[cyclopropane-1,5′-*endo*-tricyclo-[5.2.1.0^{2,6}]deca-3,8-diene-10′,1″-cyclopropane]

Rafał Grubba, Łukasz Ponikiewski* and Jerzy Pikies

Chemical Faculty, Gdańsk University of Technology, Narutowicza 11/12, Gdańsk PL 80233, Poland
Correspondence e-mail: lukasz.ponikiewski@pg.gda.pl

Received 1 June 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.060; wR factor = 0.168; data-to-parameter ratio = 17.9.

The title compound, $C_{14}H_{16}$, is built up from three five-membered rings. Two of the five-membered rings display an envelope conformation and the third one is almost planar (r.m.s. deviation = 0.014 Å).

Dispiro[cyclopropane-1,5'-*endo*-tricyclo[5.2.1.0^{2,6}]deca-3,8-diene-10',1''-cyclopropane]

R. Grubba, L. Ponikiewski and J. Pikies

Comment

The title compound (I) is a product of cyclodimerization of spiro[2.4]hepta-4,6-diene. After few weeks of storing of the starting diene at room temperature big crystals of (I) were isolated with relatively high yield. In contrast to previously reported method of synthesis of (I) (Khusnutdinov *et al.* 1988), we did not use the additional heating and the catalyst.

The X-ray crystallographic analysis confirms this proposed molecular structure (Fig. 1). The $C_{14}H_{16}$ is built up from three five-membered rings and two three-membered rings. The one of the five-membered rings (C2—C3—C4—C5—C6) is almost planar. The mean deviation of the five atoms C2, C3, C4, C5, C6 from their least-squares plane is 0.0136 Å. Additionally, the C5 atom is a junction between the five-membered ring and a cyclopropane ring. The dihedral angle between the central ring planes is 89.89 (2)°.

The second and third five-membered rings (C1—C2—C6—C7—C10 and C7—C8—C9—C1—C10) have an envelope conformation.The C10 atom is a junction with the second cyclopropane ring.

The typical C2=C3 and C6=C7 double bonds lengths 1.312 (3) Å, 1.309 (3) Å respectively suggest that the C2, C3, C6, C7 atoms are sp^2 hybridized. The bond lengths and angles are within normal ranges (Brookings *et al.* 2001; Caira *et al.* 1995; Haumann *et al.* 1997).

Experimental

Spiro[2.4]hepta-4,6-diene was obtained according to the literature procedure (Wilcox *et al.*, 1961). First fraction from the final distillation of spiro[2.4]hepta-4,6-diene (2.05 g) was stored at room temperature for few weeks. After this time large, colorless crystals of the title compound deposited with 54% (1.10 g) yield.

Refinement

All H atoms were positioned geometrically and refined using a riding model, with C–H = 0.93–0.98 Å, U_{iso}(H) = 1.2 U_{eq}(C).

Figures

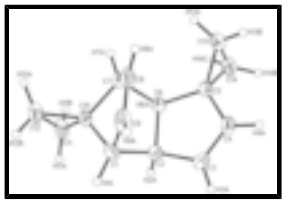

Fig. 1. The molecular structure of the title compound showing the atom-labelling scheme and displacement ellipsoids at the 25% probability level.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.060$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.168$	H-atom parameters constrained
$S = 0.99$	$w = 1/[\sigma^2(F_o^2) + (0.095P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2269 reflections	$(\Delta/\sigma)_{max} < 0.001$
127 parameters	$\Delta\rho_{max} = 0.22$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.15$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 2 June 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.013 Å; R factor = 0.055; wR factor = 0.157; data-to-parameter ratio = 14.0.

In the title compound, $C_{15}H_{11}IN_4OS$, intramolecular N—H···N, N—H···O and C—H···S interactions generate one $S(5)$ and two $S(6)$ ring motifs. In the crystal, molecules form centrosymmetric dimers *via* pairs of N—H···O interactions, generating $R_2^2(8)$ ring motifs. In addition a short intermolecular I···S contact of 3.352 (3) Å is observed.

4-(3-Iodophenyl)-1-(2-oxoindolin-3-ylidene)thiosemicarbazide

H. Pervez, M. Yaqub, M. Ramzan and M. N. Tahir

Comment

As a part of our drug discovery program, we very recently reported the synthesis and biological evaluation of a number of N^4-aryl substituted isatins-thiosemicarbazones (Pervez *et al.*, 2007, 2008, 2010*a*). In continuation of the same, we report herein the structure and synthesis of the title compound (I, Fig. 1).

The crystal structure of (II) *i.e.* 4-(3-methoxyphenyl)-1-(2-oxoindolin-3-ylidene)thiosemicarbazides has been published (Pervez *et al.*, 2010*b*). The title compound differs from (II) due to the presence of iodo instead of methoxy function at position-3 of the phenyl ring substituted at N^4 of the thiosemicarbazone moiety.

In (I) the 2-oxoindolin A (C1–C8/N1/O1), thiosemicarbazide B (N2/N3/C9/S1/N4) and phenyl ring of 2-ethylphenyl C (C10—C16) are planar with r. m. s. deviations of 0.0086, 0.0029 and 0.0414 Å, respectively. The dihedral angle between A/B, A/C and B/C is 4.65 (41)°, 11.89 (41)° and 13.37 (37)°, respectively. Due to intramolecular H-bondings (Table 1, Fig. 1), one S(5) and two S(6) (Bernstein *et al.*, 1995) ring motifs are formed. The molecules are dimerized (Fig. 2) due to intermolecular H-bonding of N—H···O type with $R_2^2(8)$ ring motifs.

Experimental

To a hot solution of isatin (0.74 g, 5.0 mmol) in ethanol (10 ml) containing a few drops of glacial acetic acid was added 4-(3-iodophenyl)thiosemicarbazide (1.47 g, 5.0 mmol) dissolved in ethanol (10 ml) under stirring. The reaction mixture was then heated under reflux for 2 h. The yellow crystalline solid formed during heating was collected by suction filtration. Thorough washing with hot ethanol followed by ether afforded the target compound (I) in pure form (1.77 g, 84%), m. p. 503 K (*d*). The single crystals of (I) were grown in acetone-ethanol (1:4) by diffusion method at room temperature.

Refinement

All H-atoms were positioned geometrically (N–H = 0.86 Å, C–H = 0.93 Å) and refined as riding with $U_{iso}(H) = xU_{eq}$(C, N), where x = 1.2 for all H-atoms. A residual peak of 2.76 e/Å^3 exists at a distance of 1.48 and 1.95 Å from C14 and C13, respectively.

Figures

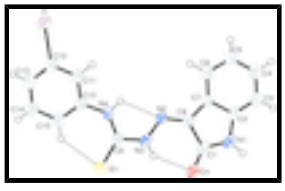

Fig. 1. View of the title molecule with the atom numbering scheme. The displacement ellipsoids are drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radii. The dotted lines indicate intramolecular hydrogen bonds.

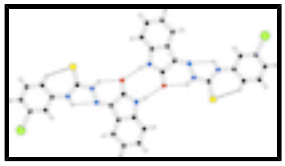

Fig. 2. The partial packing (*PLATON*; Spek, 2009) which shows that molecules form dimers.

4-(3-Iodophenyl)-1-(2-oxoindolin-3-ylidene)thiosemicarbazide

Crystal data

$C_{15}H_{11}IN_4OS$	$F(000) = 824$
$M_r = 422.24$	$D_x = 1.822$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 1677 reflections
$a = 5.7620$ (3) Å	$\theta = 2.7$–$25.3°$
$b = 16.7989$ (11) Å	$\mu = 2.22$ mm^{-1}
$c = 16.152$ (1) Å	$T = 296$ K
$\beta = 100.153$ (4)°	Needle, yellow
$V = 1538.96$ (16) Å^3	0.32 × 0.14 × 0.12 mm
$Z = 4$	

Data collection

Bruker Kappa APEXII CCD diffractometer	2778 independent reflections
Radiation source: fine-focus sealed tube	1677 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.022$
Detector resolution: 8.10 pixels mm^{-1}	$\theta_{max} = 25.3°$, $\theta_{min} = 2.7°$
ω scans	$h = -6 \rightarrow 6$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -20 \rightarrow 20$
$T_{min} = 0.742$, $T_{max} = 0.752$	$l = -16 \rightarrow 19$
11310 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.055$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.157$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0776P)^2 + 1.1429P]$ where $P = (F_o^2 + 2F_c^2)/3$
2778 reflections	$(\Delta/\sigma)_{max} < 0.001$
199 parameters	$\Delta\rho_{max} = 2.76$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.48$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 4 June 2010; accepted 15 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.002 Å; R factor = 0.038; wR factor = 0.095; data-to-parameter ratio = 13.5.

The title Schiff base, $C_{17}H_{14}N_2O_3$, exists as an NH tautomer with the H atom of the phenol group transferred to the imine N atom. The iminium H atom is involved in a strong intramolecular N^+—H···O^- hydrogen bond to the phenolate O atom, forming an $S(6)$ motif. In the crystal structure, N—H···O hydrogen bonds form a $C(9)$ chain parallel to [100] and a $C(11)$ chain parallel to [010], while C—H···O hydrogen bonds form a $C(11)$ chain parallel to [010]. The combination of N—H···O and C—H···O hydrogen bonds generates $R_4^3(30)$ rings parallel to the *ab* plane

Comment

Coumarin and its derivatives have been a subject of numerous investigations due to their diverse biological activities, interesting photophysical, photochemical and metal binding properties. Schiff base complexes play an important role in coordination chemistry (Patil *et al.*, 2010). We have recently reported synthesis, single-crystal X-ray diffraction studies, characterization and antibacterial activity of a Schiff-base ligand incorporating coumarin moiety and their metal complexes (Aazam *et al.*, 2006; El Husseiny, *et al.*, 2008; Aazam *et al.*, 2008). In this work, we would like to present an X-ray investigation of a newly synthesized coumarin Schiff base derived from 8-acetyl-7-hydroxycoumarin and *o*-phenylenediamine. We report here the crystal structure of (I) (Figure 1).

Schiff bases exhibit two well known tautomeric forms *viz*. OH and NH tautomers. NH tautomers can be regarded as a resonance hybrid of two canonical structures the non-charged quinoid and ionic zwitterionic forms. Our investigations show that compound (I) formula can be given as a combination of two canonical forms: phenolate with negative charge predominantly at the phenolate O atom or as chromen-8-ide with negative charge at the C atom. Compound I is a hyprid of two zwitterionic canonical forms (Fig. 2) having N^{+}—H bond (0.952 Å) longer than standared interatomic separations observed in neutral N—H bonds (0.878 Å)(Karabıyık *et al.*, 2008). Compound (I) crystallizes in the orthorhombic space group Pbca (No. 61) with one molecule per asymmetric unit. The iminium H atom is almost coplanar with the coumarin ring (deviation from the coumarin plane 0.0444 Å) and on the same side of the molecule as the phenolic O atom, allowing the formation of an intramolecular N—H···O hydrogen bond. A summary of bond lengths and angles of the ketoimine system is presented in Table 1.

In order to compare the bond lengths found in (I) with other molecules containing similar functional groups, a comparison with a previous search in the Cambridge Structural Database (CSD) was performed (Filarowski, 2005). The comparison with the mean bond lengths of similar molecules clearly tends to confirm that (I) is *cis*-ketoimine tauutomer and that the C7—N1 in agreement with double-bond character, the C10—O1 is 1.3040 Å, this bond is not double (keto group) and is one of the longest among similar iminium derivatives, also C7—C9 bond length is not a typical single-bond. Moreover C9—C14 ring is in agreement with the cyclohexadienide bond character. The intramolecular hydrogen bond produces S(6) motif (Bernstein *et al.*, 1995). The amino atom N2 in the molecule at (*x*, *y*, *z*) acts as a hydrogen-bond donor (Table 1) to atom $O1^{i}$ so forming a C(9) chain running parallel to the [100] direction. Amino atom N2 in the molecule at (*x*, *y*, *z*) acts as a hydrogen-bond donor to atom $O2^{ii}$ so forming a C(11) chain running parallel to the [010] direction. Similarly, atom C5 in the molecule at (*x*, *y*, *z*) acts as a hydrogen-bond donor to atom $O2^{iii}$ so forming a C(11) chain running parallel to the [010] direction. The combination of N—H···O and C—H···O hydrogen bonds generates $R_4^3(30)$ rings parallel to the *ab* plane (Fig. 3).

Experimental

A clear solution of *o*-phenylenediamine (0.26 g, 2.5 mmol) in 10 ml of ethanol was added to a warm solution of 8-acetyl-7-hydroxy coumarin (0.5 g, 2.5 mmol) in the same solvent (30 ml). The resulting mixture was refluxed for 2–3 h. The yellow

product was precipitated, filtered off and washed with ethanol followed by diethyl ether, dried in a vacuum desiccator and crystallized from chloroform/ethanol (2:1). Single crystals were obtained by slow evaporation of dichloromethane solution of I at room temperature; Yield (75%), m.p. 480 K. Purity of the ligand was checked using TLC; (methanol: benzene, 1:4).

Refinement

All H atoms bound to C atoms were refined using a riding model, with C—H = 0.93Å and U_{iso}(H) = 1.2U_{eq}(C) for aromatic C atoms and C—H = 0.96Å and U_{iso}(H) = 1.5U_{eq}(C) for methyl C atoms. Amino H atoms bound to N atom were located in difference maps and refined freely. Other H atom bound to N atom was located in difference maps and refined subject to a *DFIX* restraint of N—H = 0.86 (2) Å.

Figures

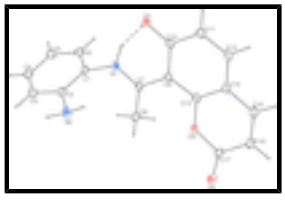

Fig. 1. A view of one molecule of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. Hydrogen bonds are indicated by dashed lines.

Fig. 2. Zwitterionic canonical forms of I.

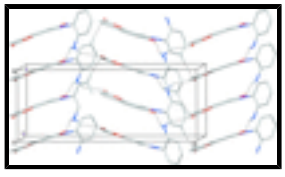

Fig. 3. Part of the crystal structure of (I), showing the formation of a hydrogen-bonded sheet built from C(9) and C(11) chains. For the sake of clarity, H atoms not involved in the motif shown have been omitted.

8-[(1*E*)-1-(2-Aminophenyliminio)ethyl]-2-oxo-2*H*-chromen-7-olate

Crystal data

$C_{17}H_{14}N_2O_3$	$F(000)$ = 1232
M_r = 294.30	D_x = 1.365 Mg m^{-3}
Orthorhombic, *Pbca*	Mo *K*α radiation, λ = 0.71073 Å
Hall symbol: -P 2ac 2ab	Cell parameters from 25561 reflections
a = 7.5462 (3) Å	θ = 2.0–26.7°
b = 18.9324 (11) Å	μ = 0.10 mm^{-1}
c = 20.0445 (9) Å	*T* = 296 K
V = 2863.7 (2) Å^3	Prism, yellow
Z = 8	0.44 × 0.29 × 0.20 mm

Data collection

Stoe IPDS 2 diffractometer	2868 independent reflections

Radiation source: fine-focus sealed tube	1972 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.039$
rotation method scans	$\theta_{max} = 26.2°$, $\theta_{min} = 2.0°$
Absorption correction: integration (*X-RED32*; Stoe & Cie, 2002)	$h = -9 \rightarrow 9$
$T_{min} = 0.962$, $T_{max} = 0.984$	$k = -23 \rightarrow 23$
25561 measured reflections	$l = -24 \rightarrow 24$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.095$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.0515P)^2 +]$ where $P = (F_o^2 + 2F_c^2)/3$
2868 reflections	$(\Delta/\sigma)_{max} < 0.001$
212 parameters	$\Delta\rho_{max} = 0.11$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.15$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.039; wR factor = 0.111; data-to-parameter ratio = 14.0.

The title compound, $C_{18}H_{18}N_2O_3$, is the product of the heterocyclic ring cleavage at position 2 of 1-propionylisatin. Two centrosymmetric cyclic motifs, *viz.* $R_2^2(14)$ and $R_2^2(18)$, are formed by N—H···O hydrogen bonds with the propanamide and aminophenyl units, respectively, as the N—H donors. These motifs combine into two $C_2^2(8)$ chain motifs parallel to the b axis. The chain structure is stabilized by C—H···π interactions between the benzene rings, where C—H is from the phenyl ring of the cleaved part of 1-propionylisatin.

N-{2-[*N*-(4-Methylphenyl)oxamoyl]phenyl}propanamide

H. Pervez, M. Ahmad, M. Yaqub, M. N. Tahir and N. Saira

Comment

We recently have reported the synthesis and crystal structures of certain isatin derivatives (Pervez *et al.*, 2009, 2010*a*, 2010*b*). The title compound (I), (Fig. 1) is the side product obtained in low yield due to the heterocyclic ring cleavage at position-2 of 1-propionylisatin when reacted with *p*-toluidine.

The crystal structures of (II) *i.e.* 2-oxo-*N*,2-diphenylacetamide (Boryczka *et al.*, 1998) and (III) *i.e. p*-tolyl-glyoxylic acid *p*-chloroanilide (Hohne & Seidel, 1979) have been published. The crystal structure of (I) differs from (II) and (III) due to substituants at the phenyl rings. The crystal structure of (IV) *i.e.* 2'-(*N*-isopropyloxamoyl)acetanilide (Zukerman-Schpector *et al.*, 1994) has been published, which has isopropyl instead of tolyl and methyl instead of ethyl when compared to (I).

In the crystal structure of (I), the tolylamino group A (C1—C7/N1) and B(C9–C15/N2) of the cleaved part of 1-propionylisatin are planar with r. m. s. deviation of 0.0364 and 0.0456 Å, respectively. The dihedral angle between A/B is 80.25 (5) °. There exist an S(5) ring motif (Bernstein *et al.*, 1995) due to N—H···O interactions (Table 1). In the central part short intramolecular C═O···C═O contact replaces a hydrogen-bond plausible S(6). The central part of (I) has twisting flexibility to set the orientation of substituated phenyl rings. The intermolecular interactions of N—H···O and C—H···O types complete $R_2^2(12)$ and $R_2^2(18)$ ring motifs setting the two molecules in dimeric way. These dimers are interlinked through N—H···O interactions with $R_2^2(14)$ ring motif (Table 1, Fig. 2). The polymeric chain extends along the crystallographic *b* axis. The C—H···π interaction (Table 1) also play role in stabilizing the molecules.

Experimental

To a refluxing solution of 1-propionylisatin (1.02 g, 5 mmol) in ethanol (15 ml) containing 2–3 drops of concentrated sulfuric acid was added the solution of *p*-toluidine (0.54 g, 5 mmol) made in ethanol (5 ml). The reaction mixture was then refluxed for 2 h, after which it was left at room temperature overnight. The reddish yellow solid formed was collected by suction filtration, washing of which with ethanol to get rid of the soluble impurities, however, gave a dirty white solid. Recrystallization of the same from ethanol furnished the title heterocyclic ring cleavage product (I) in pure form (0.33 g, 21%) m.p. 423 K. The single crystals of (I) for *x*-ray analysis were grown in ethyl acetate-petroleum ether (1:4) by diffusion method at room temperature.

Refinement

The H-atoms were positioned geometrically (N–H = 0.86 Å, C–H = 0.93–0.97 Å) and refined as riding with $U_{iso}(H) = xU_{eq}(C, N)$, where $x = 1.5$ for methyl and $x = 1.2$ for all other H-atoms. !5

Figures

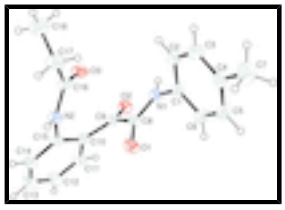

Fig. 1. View of the title compound with the atom numbering scheme. The displacement ellipsoids are drawn at the 30% probability level. H-atoms are shown by small circles of arbitrary radii.

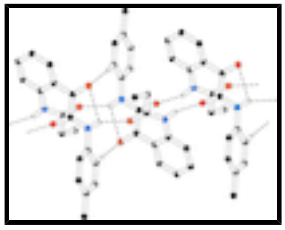

Fig. 2. The partial packing (*PLATON*; Spek, 2009) which shows that molecules arranged *via* hydrogen bonds into one-dimensional polymeric chains extending along the *b* axis.

$V = 820.63$ (6) Å^3	

Data collection

Bruker Kappa APEXII CCD diffractometer	2933 independent reflections
Radiation source: fine-focus sealed tube	2402 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.023$
Detector resolution: 8.2 pixels mm^{-1}	$\theta_{max} = 25.3°$, $\theta_{min} = 2.8°$
ω scans	$h = -11 \rightarrow 10$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -11 \rightarrow 11$
$T_{min} = 0.942$, $T_{max} = 0.952$	$l = -12 \rightarrow 12$
11476 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0538P)^2 + 0.1939P]$ where $P = (F_o^2 + 2F_c^2)/3$
2933 reflections	$(\Delta/\sigma)_{max} < 0.001$
210 parameters	$\Delta\rho_{max} = 0.18$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.21$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.029; wR factor = 0.071; data-to-parameter ratio = 6.0.

The molecule of the title compound, $C_{13}H_{10}N_2O_4$, is almost planar with a dihedral angle between the benzene rings of 1.99 (13)°. The nitro group and its parent benzene ring are oriented at a dihedral angle of 7.6 (3)°. Intramolecular C—H···O and N—H···O hydrogen bonds form two planar S(6) motifs. Intermolecular O—H···O=C hydrogen bonds join molecules into chains extending along the c axis.

2-Hydroxy-5-nitro-*N*-phenylbenzamide

A. R. Raza, B. Nisar and M. N. Tahir

Comment

The title compound (I), (Fig. 1) has been synthesized as a precursor for benzoxazepines.

Previously, we have reported the crystal structures of N-phenyl-2-hydroxy-3-nitrobenzamide (Raza *et al.*, 2009a). The title compound differs from it due to the attachement of nitro group at position-5 instead of position-3. We, also have reported the crystal structure of 2-hydroxy-5-nitrobenzamide (Raza *et al.*, 2009b) which is related to (I).

In (I), the phenyl rings, A (C1–C6) of 2-hydroxy-5-nitrobenzamide and B (C8–C13) attached with 2-hydroxy-5-nitrobenzamide are planar with r. m. s. deviation of 0.0027 Å and 0.0031 Å, respectively. The O-atom of hydroxy group is at a distance of 0.014 (3) Å from the mean square plane of parent ring A. Nitro group C (O2/N1/O3) is of course planar. The dihedral angle between A/B, A/C and B/C is 1.99 (13)°, 7.63 (33)° and 6.20 (34)°, respectively. There exist a weak intramolecular H-bonding of C—H···O type forming an S(5) and a S(6) ring motif (Bernstein *et al.*, 1995), whereas H-bonding of N—H···O type complete an S(6) ring motif. The intermolecular H-bonding of C—H···O and O—H···O types complete $R_2^1(6)$ ring motif (Table 1, Fig. 2). The molecules are essentially stabilized in the form of one dimensional chains extending along the c-axis. However, weak interactions of C—H···O type form 2-dimensional polymeric sheets (Fig. 2).

Experimental

A solution of *N*-pheny-2-hydroxybenzamide (5.3 g, 0.025 mol) in ethyl acetate (EtOAc) (25 mL) was added dropwise to a nitrating mixture of HNO_3 (2.25 mL, 3.15 g , 0.05 mol) and H_2SO_4 (1.33 mL, 2.45 g, 0.025 mol) with constant stirring while the temperature was kept below 278 K. The reaction mixture was refluxed for 5 h, cooled to room temperature, neutralized with aqueous $NaHCO_3$ (10%) and extracted with EtOAc (3 × 25 mL). The organic extract was combined, dried over anhydrous Na_2SO_4, filtered and concentrated under reduced pressure to afford reddish brown solid. The column chromatographic purification with 0, 2.5, and 5 % EtOAc in n-hexane (0.5 L each) over a silica gel packed column (25.5 cm) afforded the title compound I in 5th-34th fraction of 50 mL each upon leaving at room temperature.

Refinement

In the absence of significant anomalous scattering effects, all Friedal pairs were merged. All H atoms were found in difference Fourier maps however for the refinement they were positioned geometrically with O–H = 0.82, N–H= 0.86 and C–H = 0.93 Å and refined as riding with U_{iso}(H) = 1.2U_{eq}(C, N) and U_{iso}(H) = 1.5U_{eq}(O).

Figures

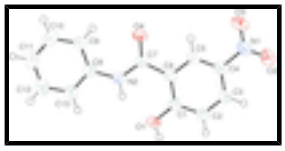

Fig. 1. View of the title compound with the atom numbering scheme. The displacement ellipsoids are drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radii.

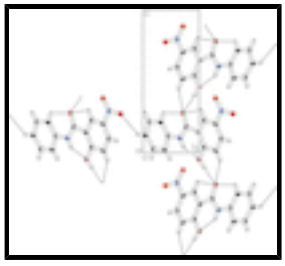

Fig. 2. The partial packing (*PLATON*; Spek, 2009) which shows that molecules form polymeric chains extending along the *c*-axis. Hydrogen bonds are shown by dashed lines.

2 restraints	$\Delta\rho_{min} = -0.13$ e Å^{-3}

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 12 April 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.044; wR factor = 0.144; data-to-parameter ratio = 18.5.

In the title compound, $C_{16}H_{18}N_2O_2$, the molecule adopts an E conformation about the C=N double bond. The dihedral angle between the pyrrole and phenyl rings is 41.55 (8)°. In the crystal structure, pairs of intermolecular N—H···O hydrogen bonds link the molecules into centrosymmetric dimers. In the dimer, the two pyrrole rings are almost coplanar and the two phenyl rings are parallel to each other.

Ethyl 3,4-dimethyl-5-[(*E*)-(phenylimino)methyl]-1*H*-pyrrole-2-carboxylate

W.-N. Wu, L. Yang, X.-X. Li, B.-F. Qin and Q.-F. Wang

Comment

Pyrrol-2-ylmethyleneamine ligands have attracted much recent attention due to their excellent coordination abilities for metal ions (Yang *et al.*, 2006 & Wang *et al.*, 2010). As part of our ongoing search for a biologically active material, the title compound was synthesized and characterized by X-ray diffraction.

In the title compound, all the bond lengths are comparable with those observed in the other similar compound (Wang *et al.*, 2009). The molecule adopts an E configuration at the C=N double bond. The dihedral angle between pyrrole ring (N2/C8–C11, r.m.s. deviation 0.0035 Å) and phenyl ring (C1–C6, r.m.s. deviation 0.0036 Å) is 41.55 (8)°. In the crystal, the molecules are linked into a centrosymmetric dimer by two intermolecular N—H···O hydrogen bonds, forming a $R_2^2(10)$ ring motif (Table1, Fig. 2). In the dimer, the two pyrrole rings are almost coplanar (r.m.s. deviation 0.028 Å) and the two phenyl rings are parallel with each other. The crystal packing is further stabilized by the stacking between the C=N with the adjacent pyrrole ring, with centroid–centroid distances of 3.642 Å.

Experimental

A quantity of aniline (0.186 g, 2 mmol) was dissolved in ethanol (10 ml), then an ethanol solution (10 ml) containing ethyl 5-formyl-3,4-dimethyl-1*H*-pyrrole-2-carboxylate (0.39 g, 2 mmol) was added dropwise at room temperature. After stirring for 4 h, the mixture was filtered and set aside to crystallize at room temperature for several days, giving yellow block crystals.

Refinement

All H atoms were placed in calculated positions, with C—H = 0.93–0.97 Å and N—H = 0.86 Å, and were thereafter treated as riding, with U_{iso}(H) values of 1.5Ueq(C) for methyl groups and 1.2Ueq(C,*N*) for others.

Figures

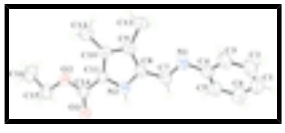

Fig. 1. The molecular structure shown with 50% probability displacement ellipsoids.

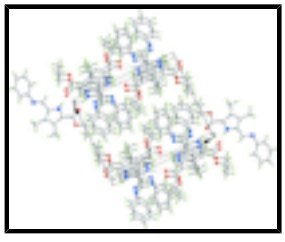

Fig. 2. Crystal packing of the title compound showing the dimers formed by hydrogen bonds (dashed lines).

Ethyl 3,4-dimethyl-5-[(*E*)-(phenylimino)methyl]-1*H*-pyrrole-2-carboxylate

Crystal data

$C_{16}H_{18}N_2O_2$	$F(000) = 576$
$M_r = 270.32$	$D_x = 1.197$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 5515 reflections
$a = 12.5463$ (7) Å	$\theta = 2.2$–$26.2°$
$b = 14.6525$ (9) Å	$\mu = 0.08$ mm^{-1}
$c = 8.4490$ (5) Å	$T = 296$ K
$\beta = 105.042$ (3)°	Block, yellow
$V = 1500.00$ (15) Å^3	0.35 × 0.26 × 0.18 mm
$Z = 4$	

Data collection

Bruker SMART CCD diffractometer	3413 independent reflections
Radiation source: fine-focus sealed tube	2078 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.030$
phi and ω scans	$\theta_{max} = 27.6°$, $\theta_{min} = 1.7°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -14 \rightarrow 16$
$T_{min} = 0.975$, $T_{max} = 0.986$	$k = -14 \rightarrow 19$
12405 measured reflections	$l = -10 \rightarrow 8$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.044$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.144$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0645P)^2 + 0.3198P]$ where $P = (F_o^2 + 2F_c^2)/3$
3413 reflections	$(\Delta/\sigma)_{max} = 0.007$
184 parameters	$\Delta\rho_{max} = 0.20$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.16$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Phenyl 2,3,4-tri-*O*-benzyl-1-thio-α-D-mannopyranoside monohydrate

Maxime Durka, Bernadette Norberg, Yvain Roué, Stéphane P. Vincent and Johan Wouters*

Department of Chemistry, University of Namur, 61 Rue de Bruxelles, B-5000 Namur, Belgium
Correspondence e-mail: johan.wouters@fundp.ac.be

Received 27 April 2010; accepted 25 May 2010

Key indicators: single-crystal X-ray study; T = 150 K; mean σ(C–C) = 0.003 Å; disorder in main residue; R factor = 0.030; wR factor = 0.062; data-to-parameter ratio = 13.0.

In the title compound, $C_{33}H_{34}O_5S\cdot H_2O$, the mannopyranoside ring adopts a chair conformation with the 2-α-thiophenyl group occupying an axial position. One of the pendant benzyl groups is disordered over two sets of sites in a 0.5:0.5 ratio. In the crystal, the water molecule makes two O—H···O hydrogen bonds to an adjacent sugar molecule with the O atoms of the primary alcohol and ether groups acting as acceptors. At the same time, the OH group of the sugar makes a hydrogen bond to a water molecule.

Phenyl 2,3,4-tri-*O*-benzyl-1-thio-*α*-D-mannopyranoside monohydrate

M. Durka, B. Norberg, Y. Roué, S. P. Vincent and J. Wouters

Comment

Oligosaccharides are natural ligands of lectins, which are important receptors involved in key biological processes. Efficient strategies for the regioselective transformations of monosaccharides to achieve glycosylation reactions or further functionalizations are of paramount importance. Furthermore, the knowledge of the conformations of carbohydrates alone or bound to protein gives access to key informations that can be exploited to understand biocatalytic processes or stereoelectronic effects (Caravano *et al.*, 2003).

Numerous strategies of protections of mannopyranosides have been described in the litterature (*e.g.* Boons, 1991; Szurmai *et al.*, 1994) in order to derivatise the primary alcohol. The title compound is also a key intermediate for the synthesis of heptosyl transferase inhibitors (Dohi *et al.*, 2008; Grizot *et al.*, 2006).

Crystal structure of the title compound confirms the expected relative stereochemistry : C1 *R*, C2 *S*, C3 *S*, C4 *R*, C5 *R*. The mannopyranoside adopts a chair conformation with puckering amplitude (Q) = 0.522 (3) Å, Theta = 3.6 (3) °, and Phi = 60 (5) ° (Cremer & Pople, 1975).

The 2-alpha-thiophenyl group on C1 and the *O*-benzyl group on C2 occupy an axial position, the two other *O*-benzyl groups (on C3 and C4) and carbon atom C6 occupying an equatorial position.

Thiophenyl-2,3,4-*O*-tri-benzyl-alpha-*D*-mannopyranoside co-crystallized with one water molecule (O_W). This water molecule is part of a H bond network involving the primary alcohol O6 and also secondary alcohol O2 (Table 1). Packing is further reinforced by van der Waals interactions involving the aromatic rings.

Experimental

The title compound was obtained by a six-step synthetic route that will be described in details elsewhere. Overall yield is 70%. Colourless prisms of (I) were obtained by evaporation of a solution in ethyl acetate.

Refinement

Disorder of the benzyl C(21) > C(27) moiety substituting oxygen O(4) was included in the refinement (0.5 occupacy for both parts that were restrained to have similar bond lengths and angles). H atoms on water oxygen atom O_W and on alcohol oxygen atom O(6) were located by Fourier difference maps and allowed to ride on their parent O atoms.

All other H atoms were placed at idealized positions and allowed to ride on their parent atoms, with C—H = 0.97 Å and $U_{iso}(H) = 1.2U_{eq}(C)$ for methylene groups, C—H = 0.93 Å and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic carbons, and C—H = 0.96 Å and $U_{iso}(H) = 1.5U_{eq}(C)$ for the methyl group.

Figures

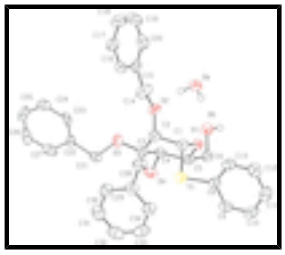

Fig. 1. The molecular structure of (I): C-bound H atoms are omitted and disorder is not presented for clarity. Displacement ellipsoids for non-H atoms are drawn at the 50% probability level.

Phenyl 2,3,4-tri-*O*-benzyl-1-thio-α-D-mannopyranoside monohydrate

Crystal data

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.030$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.062$	$w = 1/[\sigma^2(F_o^2) + (0.0359P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.97$	$(\Delta/\sigma)_{max} = 0.001$

5205 reflections	$\Delta\rho_{max}$ = 0.13 e Å^{-3}
400 parameters	$\Delta\rho_{min}$ = −0.17 e Å^{-3}
17 restraints	Absolute structure: Flack (1983), 2381 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.01 (5)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Tetrabutylammonium bis[4,4′-dimethyl-2,2′-(3,7-dimethyl-1*H*-4,2,1-benzothiazasiline-1,1-diyl)dibenzenethiolato]-vanadium(III) acetonitrile tetrasolvate

Yi-Fang Tsai,[a] Hua-Fen Hsu,[a]* Kuei-Fang Hsu[a] and Ju-Chun Wang[b]

[a]Department of Chemistry, National Cheng Kung University, Tainan 701, Taiwan, and [b]Department of Chemistry, Soochow University, Taipei, Taiwan
Correspondence e-mail: konopka@mail.ncku.edu.tw

Received 27 April 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 200 K; mean σ(C–C) = 0.005 Å; R factor = 0.053; wR factor = 0.144; data-to-parameter ratio = 22.3.

In the title compound, $[N(C_4H_9)_4][V(C_{23}H_{21}NS_3Si)_2]\cdot 4CH_3CN$, the V^{III} atom (site symmetry $\overline{1}$) is coordinated by two *N*,*S*,*S*′-tridentate 4,4′-dimethyl-2,2′-(3,7-dimethyl-1*H*-4,2,1-benzothiazasiline-1,1-diyl)dibenzenethiolate ligands in a distorted *trans*-VN_2S_4 octahedral geometry. The complete cation is generated by crystallographic twofold symmetry, with the V atom lying on the rotation axis. The unusual ligand arose from nucleophilic attack on the coordinated nitrile by the thiolate precursor and reduction of nitrile to the imidate.

Comment

Vanadium thiolate chemistry has been drawing much attention due to its biological relevance as well as its medical application (Rehder, 2008; Crans *et al.*, 2004). For example, alternative nitrogenase is proposed to contain a [Fe_7VS_9] cofactor, where V site likely binds to three sulfides, His442 and homocitrate (Eady, 2003). To elucidate the role of vanadium in the enzyme, it is essential to understand fundamental chemistry of vanadium, particularly in a S-rich ligation environment (Janas & Sobota, 2005). Thus, we have been exploring the reactions of vanadium ion with thiolato containing ligands (Ye *et al.*, 2010; Tsai *et al.*, 2007). At this work, the reaction of [VCl_3THF_3] with H_3L1 [H_3L1 = HSi(5-Me–C_6H_4-2-SH)$_3$] and three equivalents of nBu-Li in CH_3CN generated a deep purple solution. The addition of the cation, [$N(C_4H_9)_4$]Br, to the reaction mixture yielded a crystalline solid of the title compound (**I**).

The molecular structure of the anion in (**I**) is shown in Fig 1. It consists a V^{III} ion coordinated to two L2 ligands [L2 = Si{CH_3(5-Me– C_6H_4-2-S)CN} (5-Me–C_6H_4-2-S)$_2$]. L2 ligand has a S2N donor set that contains two benzenethiolates and one thioimidate group. The formation of a thioimidate group in L2 ligand upon the reaction is likely a consequence of nucleophilic attack on the coordinated nitrile by thiolate and reduction of nitrile to the imidate. Similar chemistry was demonstrated in a rhenium complex with thiolate ligands (Block *et al* ., 1989). The V^{III} ion lies on the inversion centre and forms a normal octahedral geometry with a S4N2 ligation environment, four S atoms from thiolate groups and two N atoms from thioimidate groups. Two N donor atoms of thioimidate groups are in *trans* positions.

The bond lengths and bond angles in compound (**I**) are shown in Table 1. The V—S distances of 2.416 (1) Å and 2.462 (1) Å are close to those of reported six-coordinate V^{III} thiolate complexes (Ye *et al.*, 2010; Zhu *et al.*, 2002; Zhu *et al.*, 1997).

The packing diagrams of compound (**I**) are shown in Fig 2. There is no interaction observed between molecules. The methyl groups on the phenyl rings of the ligands probably prevent the occurrence of inter-molecular π-π stacking interactions. The shortest distance between centers of two phenyl rings is 5.181 (2) Å.

Experimental

A THF solution of $VCl_3(THF)_3$ (0.094 g, 0.25 mmol) was added to a acetonitrile solution (10 ml) of HSi(5-Me–C_6H_4-2-SH)$_3$ (0.202 g, 0.51 mmol) and n-BuLi (0.098 g, 1.53 mmol) to generate a deep purple solution. The solution was concentrated and layered with [$N(C_4H_9)_4$]Br (0.080 g, 0.25 mmol) in acetonitrile solution (5 ml). After one week, deep purple blocks of (I) were obtained.

Refinement

H atoms were generated geometrically, with *C*—H_{methyl} = 0.96 Å; *C*—H_{aryl} = 0.93 Å; $U_{iso}H_{methyl}$ = 1.5U_{eq}(C_{methyl}); $U_{iso}H_{aryl}$ = 1.2U_{eq}(C_{aryl}). In case of the CH_3 group, the positional parameters of the hydrogens were constrained by the SHELXL-97 command to the idealized tetrahedral geometry by the command AFIX 137 (Sheldrick, 2008).

Figures

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 28 April 2010; accepted 20 May 2010

Key indicators: single-crystal X-ray study; T = 116 K; mean σ(C–C) = 0.002 Å; R factor = 0.036; wR factor = 0.099; data-to-parameter ratio = 13.5.

In the title compound, $C_{33}H_{32}ClNO_2$, the benzene ring is oriented at dihedral angles of 6.23 (5) and 66.44 (5)° with respect to the two naphthalene ring systems. An intramolecular O—H···N hydrogen bond between the hydroxy H atom and the amine N atom generates an S(6) ring.

(1*R**,2*R**)-1-(4-Chlorophenyl)-4-dimethylamino-1-(3-methoxy-2-naphthyl)-2-(1-naphthyl)butan-2-ol

P. Liu, J. Xiao, W. Zhong, S. Li and X. Yang

Comment

The compound (1*R*,2S)-1-(6-bromo-2-methoxyquinolin-3-yl)-4-(dimethylamino)-2-(naphthalene- 1-yl)-1-phenylbutan-2-ol, is a promising drug against tuberculosis (Andries *et al.*, 2005; Cohen, 2004 and Guillemont *et al.* 2004). We modified this compound in order to get some more efficient antituberculosis drugs. To characterize our product its single crystal structure was determined.

In the molecule of the title compound (Fig.1), the dihedral angle between the naphthalene ring (C20—C29) and the benzene ring (C13—C18) amount to 6.232 (46)° whereas the other naphthalene ring (C2—C10) is oriented with respect to the benzene ring at a dihedral angle of 66.438 (51)°. In the structure an intramolecular O—H···N hydrogen bond is found (Tab. 1).

Experimental

n-BuLi (2.5M in hexanes, 4 ml, 10 mmol) was added slowly at 233 K under N_2 to a solution of diisopropylamine (1.4 ml, 10 mmol) in THF (15 ml). The mixture was stirred at 233k for 30 min, then cooled to 195 K. Afterwards a solution of 2-(4-chlorobenzyl)-3-methoxynaphthalene (2.59 g, 9.2 mmol) in THF (20 ml) was added slowly. The mixture was stirred at 195 K for about 40 min and then a solution of 3-(dimethylamino)-1-(naphthalen-1-yl)propan-1-one (2.9 g, 12.8 mmol) in THF (20 ml) was added slowly. The mixture was stirred at 195 K for 8 h, hydrolyzed with ice water at 233 K and extracted with ethyl acetate. The organic layer was separated, dried over $MgSO_4$, filtered and the solvent was evaporated. The residue was purified by column chromatography over silica gel (eluent: petroleum ether/ethyl acetate, 50/1). Two fractions were collected (Guillemont *et al.*, 2004). On evaporation of the solvent (petroleum ether/ethyl acetate, 50/1) from fraction at room temperature in air colourless prisms of (I) were obtained.

Refinement

All H atoms were positioned with ideal geometry (O—H H atoms allowed to rotate but not to tip) and with d(C—H)=0.93 Å for aromatic, 0.98 Å for CH, 0.97 Å for CH_2 and 0.96 Å for CH_3 atoms and were refined with Uiso(H) = 1.2 Ueq(C) for CH and CH_2 H atoms and Uiso(H) = 1.5 Ueq(C) for CH_3 and O—H H atoms.

Crystal data

$C_{33}H_{32}ClNO_2$	$F(000) = 1080$
$M_r = 510.05$	$D_x = 1.306$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 8940 reflections
$a = 18.712$ (5) Å	$\theta = 2.2$–$27.9°$
$b = 9.135$ (2) Å	$\mu = 0.18$ mm^{-1}
$c = 16.369$ (4) Å	$T = 116$ K
$\beta = 111.991$ (4)°	Prism, colorless
$V = 2594.2$ (11) Å^3	0.20 × 0.16 × 0.12 mm
$Z = 4$	

Data collection

Rigaku Saturn CCD diffractometer	4573 independent reflections
Radiation source: rotating anode	3918 reflections with $I > 2\sigma(I)$
multilayer	$R_{int} = 0.032$
Detector resolution: 14.63 pixels mm^{-1}	$\theta_{max} = 25.0°$, $\theta_{min} = 2.4°$
ω and φ scans	$h = -19 \rightarrow 22$
Absorption correction: multi-scan (*CrystalClear*; Rigaku/MSC, 2005)	$k = -10 \rightarrow 10$
$T_{min} = 0.965$, $T_{max} = 0.979$	$l = -19 \rightarrow 19$
18901 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.099$	H-atom parameters constrained
$S = 1.09$	$w = 1/[\sigma^2(F_o^2) + (0.0587P)^2 + 0.0772P]$

	where $P = (F_o^2 + 2F_c^2)/3$
4573 reflections	$(\Delta/\sigma)_{max} = 0.001$
338 parameters	$\Delta\rho_{max} = 0.18$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.31$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

3-(6-Methoxy-2-naphthyl)-1-(2-pyridyl)-prop-2-en-1-one

Xiang-biao Li

Yibin Vocational & Technical College, Si chuan, People's Republic of China
Correspondence e-mail: yaocheng@njut.edu.cn

Received 29 April 2010; accepted 8 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.010 Å; R factor = 0.071; wR factor = 0.080; data-to-parameter ratio = 13.4.

There are two molecules in the asymmetric unit of the title compound, $C_{19}H_{15}NO_2$, in which the dihedral angles between the naphthalene ring system and the pyridine ring are 40.5 (3) and 41.2 (4)°. In the crystal, C—H···O hydrogen bonds link the molecules.

3-(6-Methoxy-2-naphthyl)-1-(2-pyridyl)prop-2-en-1-one

X. Li

Experimental

In the presence of sodium hydroxide, 6-methoxy-2-naphthaldehyde and 1-(pyridin-2-yl)ethanone in liquid ammonia were stirred at 313 K for 4 h. Sodium hydroxide was filtered off and the filtrate was duluted with dichlormethane and washed by brine. The organic phase was dried over anhydrous sodium sulfate, filtered, and concentrated to give crude product which was recrystallised from from dichlormethane to give yellow blocks of (I).

Refinement

The absolute structure of the title compound is indeterminate in the present refinement. H atoms were positioned geometrically, with C-H = 0.93, 0.97 and 0.96 Å for aromatic, methylene and methyl H, respectively, and constrained to ride on their parent atoms, with $U_{iso}(H) = xU_{eq}(C)$, where x = 1.5 for methyl H and x = 1.2 for all other H atoms.

Figures

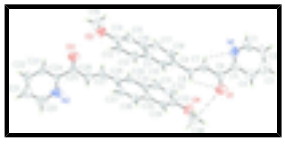

Fig. 1. Ellipsoid plot.

3-(6-Methoxy-2-naphthyl)-1-(2-pyridyl)prop-2-en-1-one

Crystal data

$C_{19}H_{15}NO_2$	$D_x = 1.310$ Mg m^{-3}
$M_r = 289.32$	Melting point: 513 K
Orthorhombic, $Pca2_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2c -2ac	Cell parameters from 25 reflections
$a = 7.8560$ (16) Å	$\theta = 9$–12°
$b = 11.542$ (2) Å	$\mu = 0.09$ mm^{-1}
$c = 32.353$ (7) Å	$T = 293$ K
$V = 2933.6$ (10) Å^3	Needle, yellow
$Z = 8$	0.20 × 0.10 × 0.10 mm
$F(000) = 1216$	

Data collection

Enraf–Nonius CAD-4 diffractometer	$R_{int} = 0.067$

Radiation source: fine-focus sealed tube	$\theta_{max} = 25.3°$, $\theta_{min} = 1.3°$
graphite	$h = 0 \rightarrow 9$
ω/2θ scans	$k = 0 \rightarrow 13$
5329 Please give correct value measured reflections	$l = -38 \rightarrow 38$
5329 independent reflections	3 standard reflections every 200 reflections
2245 reflections with $I > 2\sigma(I)$	intensity decay: 1%

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.071$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.080$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0012P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
5329 reflections	$(\Delta/\sigma)_{max} < 0.001$
397 parameters	$\Delta\rho_{max} = 0.16$ e Å^{-3}
4 restraints	$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Hexakis(4-acetylpyridinium) octadecachloridotetraantimonate(III)

Xue-qun Fu

Ordered Matter Science Research Center, Southeast University, Nanjing 210096, People's Republic of China
Correspondence e-mail: fuxuequn222@163.com

Received 10 May 2010; accepted 31 May 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.006 Å; R factor = 0.030; wR factor = 0.070; data-to-parameter ratio = 22.2.

The title compound, $(C_7H_8NO)_6[Sb_4Cl_{18}]$, contains centrosymmetric hexaanions built up from four vertex-sharing alternating $SbCl_5$ square-based pyramids and highly distorted $SbCl_6$ octahedra when long (<3.2 Å) 'secondary' Sb—Cl interactions are taken into account. The inter-polyhedral Sb—Cl bonds define a square-shape. In the crystal, the components are linked by N—H···Cl, C—H···Cl and C—H···O hydrogen bonds, generating a three-dimensional network.

Hexakis(4-acetylpyridinium) octadecachloridotetraantimonate(III)

X. Fu

Comment

As a continuation of our study of phase transition materials, including organic ligands (Li *et al.*, 2008), metal-organic coordination compounds (Zhang *et al.*, 2009), organic-inorganic hybrids, we studied the dielectric properties of the title compound, unfortunately, there was no distinct anomaly observed from 93 K to 400 K, (m.p. 421–423 K), suggesting that this compound should be not a real ferroelectrics or there may be no distinct phase transition occurred within the measured temperature range. In this article, the crystal structure of (I) has been presented.

4-Acetylpyridine may be used as a ligand in coordination compounds *e.g.* with Zn (Steffen & Palenik, 1977) or Ni (Pang *et al.*, 1994). The crystal structures of 4-acetylpyridine together with inorganic acids are also known *e.g.* with sulfuric acid (Fu, 2009b) and perchloric acid (Fu, 2009a).

The cell unit of the title compound is made up of six almost planar protonated 4-acetylpyridinium cations and a $[Sb_4Cl_{18}]^{6-}$ anion (Fig. 1.).In the coordinate anion of $[Sb_4Cl_{18}]^{6-}$, antimony(III) atoms have two kinds of coordination pattern. Sb^{3+}(2) coordinated with five Cl ions construct a distorted tetragonal pyramidal structure, composing two briding and three terminal Cl atoms. There are Cl—Sb secondary bonds by the linkage between the Sb^{3+}(1)···Cl5 and Sb^{3+}(1)···Cl6, with the bond lengths of these secondary bonds 3.0210 (11)Å and 3.1280 (11) Å, respectively, compared to the normal coordination bonds of Sb—Cl 2.3516 (12)Å to 2.8937 (11) Å. Owing to these secondary bonds, the coordination number of the central ion Sb^{3+}(1) increases to six, and it adopts a distorted octahedral geometry.

The tridimensional network arrangement in the crystal structure of (I) is mainly determined by relatively strong and directional hydrogen bonds (Table. 1),

Experimental

2.28 g (10 mmol) $SbCl_3$ was firstly dissolved in 10 ml 1:1 HCl solution, to which 2.42 g (20 mmol) 4-acetylpyridine ethanol solution was then added under stirring. Hydrochloric acid was added until the precipitated substrates disappeared. The acid solution was allowed to slowly evaporate at room temperature until colorless prisms of (I) were grown.

Refinement

Positional parameters of all the H atoms were calculated geometrically and were allowed to ride on the C and N atoms to which they are bonded, with $U_{iso}(H) = 1.2U_{eq}(C)$,

$U_{iso}(H) = 1.2U_{eq}(N)$.

Figures

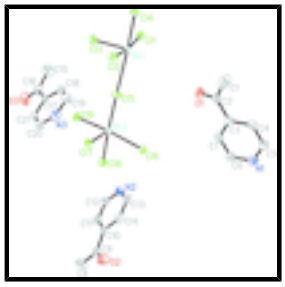

Fig. 1. The molecular structure of (I) with displacement ellipsoids drawn at the 30% probability level (all H atoms have been omitted for clarity). Unlabelled atoms are generated by the symmetry operation (2–x, 1–y, 1–z).

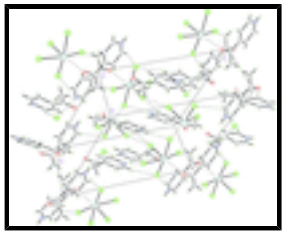

Fig. 2. A view of the packing of (I), stacking along the *a* axis. Dashed lines indicate hydrogen bonds.

Radiation source: fine-focus sealed tube	6371 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.028$
Detector resolution: 13.6612 pixels mm^{-1}	$\theta_{max} = 27.5°$, $\theta_{min} = 3.1°$
ω scans	$h = -11 \rightarrow 11$
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)	$k = -17 \rightarrow 17$
$T_{min} = 0.430$, $T_{max} = 0.622$	$l = -19 \rightarrow 19$
17638 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.030$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.070$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0307P)^2 + 0.5066P]$ where $P = (F_o^2 + 2F_c^2)/3$
7613 reflections	$(\Delta/\sigma)_{max} = 0.001$
343 parameters	$\Delta\rho_{max} = 0.39$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

2-Oxo-4-trifluoromethyl-2*H*-chromen-7-yl 2-bromo-2-methylpropanoate

N. Haridharan, V. Ramkumar and R. Dhamodharan*

Department of Chemistry, IIT Madras, Chennai, TamilNadu, India
Correspondence e-mail: damo@iitm.ac.in

Received 13 May 2010; accepted 28 May 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.004 Å; R factor = 0.040; wR factor = 0.109; data-to-parameter ratio = 18.9.

In the title compound, $C_{14}H_{10}BrF_3O_4$, the coumarin ring system is almost plannar (r.m.s. deviation = 0.025 Å) and a short C—H···F contact occurs. The propanoate fragment is orientated almost perpendicular to the ring [dihedral angle = 71.80 (12)°]. In the crystal, molecules are linked by C—H···O hydrogen bonds, generating [100] chains.

2-Oxo-4-trifluoromethyl-2*H*-chromen-7-yl 2-bromo-2-methylpropanoate

N. Haridharan, V. Ramkumar and R. Dhamodharan

Comment

The title compound $C_{14}H_{10}BrF_3O_4$, is a monofunctional coumarin derivative, which is used as an initiator (Sinkel *et al.* 2008) in Atom Transfer Radical Polymerization (ATRP). Being a monofunctional unit it can form end-functionalized linear polymers (Matyjaszewski *et al.* 2008; Stenzel-Rosenbaum *et al.*2001) when used as an initiator. Since most of the synthesized functionalized initiators are characterized by other techniques, their single crystal XRD reports are few.

The title compound is one such successful ATRP initiator which was crystallised from chloroform. It contains coumarin derivative with bromo methyl propanoate. The coumarin moiety is an important oxygen containing heterocyclic compound with diverse bioactivities such as non peptidic HIV protease inhibition and tyrosine kinase inhibition. Owing to such interesting properties, the synthesis of coumarin based initiators and their crystal structures are worth while to study.

In the title compound C_{14} H_{10} Br F_3 O_4, the coumarin ring system is plannar with the 2-bromo-2-methyl propanoate moiety almost perpendicular. The C—F bond lengths of 1.333 (2) Å,1.324 (3)Å and 1.331 (3)Å are normal in this structure. One F atom (F1) lie in plane with the coumarin ring system and the other two F atoms are above and below the plane. The torsion angle of C6—C7—O3—C11 and C8—C7—O3—C11 are -114.21 (3)° and 71.42 (2)° respectively. The crystal is stabilized by intermolecular C—H···O hydrogen bond.

Experimental

7-Hydroxy-4-trifluoromethylcoumarin 5 g (0.02 mole), triethylamine 4.83 g (0.04 mole) and THF (400 ml) were placed in a 3-neck round bottomed flask. Bromoisobutyrl bromide 10.9 g (0.04 mole) was added slowly, using a syringe, with stirring, upon which an white precipitate of triethylammonium bromide was formed. The mixture was left to react for 6 hours, with stirring. Subsequently, triethylammonium bromide, the precipitate was removed by filtration and the THF was removed by rotary evaporation. The resulting crude product was dissolved in ethyl acetate, washed with bicarbonate solution and then with water thrice followed by brine solution and dried over anhydrous sodium sulphate. The resulting solvent was removed by rotary evaporation. The product was purified by column chromatography technique using 15% ethyl acetate in hexane as the eluent to obtain pure initiator as a bright white solid. Recrystallization of the compound from chloroform gave colourless blocks of (I).

Refinement

All hydrogen atoms were fixed geometrically and allowed to ride on the parent carbon atoms, with aromatic C—H = 0.93 Å and methyl C—H = 0.96 Å. The displacement parameters were set for phenyl H atoms at $U_{iso}(H) = 1.2U_{eq}(C)$ and methyl H atoms at $U_{iso}(H) = 1.5U_{eq}(C)$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.109$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0464P)^2 + 0.448P]$ where $P = (F_o^2 + 2F_c^2)/3$
3796 reflections	$(\Delta/\sigma)_{max} < 0.001$
201 parameters	$\Delta\rho_{max} = 0.78$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.85$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 17 May 2010; accepted 30 May 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.010 Å; R factor = 0.036; wR factor = 0.088; data-to-parameter ratio = 12.9.

In the title compound, $[Gd(C_6H_6O_3S)(H_2O)_7](C_6H_6O_3S)(NO_3)\cdot 4C_{10}H_8N_2\cdot 2H_2O$, the Gd^{III} ion is octacoordinated by seven water molecules and one O-bonded 4-aminobenzenesulfonate anion in a square-antiprismatic arrangement. In the crystal, the components are linked by N—H···O, O—H···N and O—H···O hydrogen bonds.

(4-Aminobenzenesulfonato)heptaaquagadolinium(III) 4-aminobenzenesulfonate nitrate 4,4'-bipyridyl tetrasolvate dihydrate

L. Hao, X. Zhang and J. Chen

Comment

The design and synthesis of metal-organic compounds has attracted continuous research interest not only because of their appealing structural and topological novelties, but also due to their interesting optical, electronic, magnetic, and catalytic properties, as well as their potential medical applications (Karthikeyan *et al.*, 1989). Here, we describe the synthesis and structural characterization of the title compound.

As shown in Figure 1, Gd(III) is octacoordinated by senven water molecules and one *p*-amino-benzenesulfonate anion. The Gd—O bond lengths are in the range of 2.370 (4)—2.439 (4) Å. In the molecule, one *p*-amino-benzenesulfonate, one nitrate, and two water molecules disassociate. N—H···O2, N—H···S, O—H···N, O—H···N, O—H···O hydrogen bonding between the cationic and anionic moieties and the uncoordinated water molecules leads to a consolidation of the structure (Fig. 2; Table 2).

Experimental

A mixture of 4-aminobenzene sulfonic acid (1 mmol 0.17 g), gadolinium(III) nitrate hexahydrate (0.5 mmol, 0.17 g), and 4,4-bipyridine (1 mmol, 0.14 g) in 10 ml distilled water was sealed in a 25 ml Teflon-lined stainless steel autoclave and was kept at 433 K for three days. Colourless blocks of (I) were obtained upon cooling. Anal. $C_{52}H_{62}GdN_{11}O_{18}S_2$: C, 46.22; H, 4.59; N, 11.41. Found: C, 46.01; H, 4.48; N, 11.23%.

Refinement

All hydrogen atoms bound to aromatic carbon atoms were refined in calculated positions using a riding model with a C—H distance of 0.93 Å and U_{iso} = 1.2U_{eq}(C). The hydrogen atoms bound to N atoms were refined in calculated positions using a riding model with a N—H distance of 0.86 Å and U_{iso} = 1.2U_{eq}(C). Water molecules are refined by using the '*DFIX*' command with the hydrogen atoms were separated with 1.38 Å, and the lengths of bond H—O were constrained with 0.82 Å with error 0.02 and U_{iso} = 1.5U_{eq} (O). The location of the water H atoms should be regarded as less certain that those of the other H atoms.

Figures

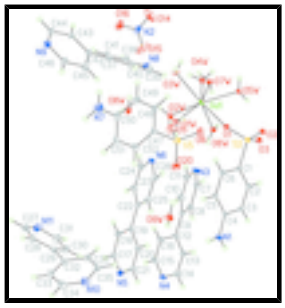

Fig. 1. The building blocks of (I) with displacement ellipsoids drawn at the 30% probability level; H atoms are given as spheres of arbitrary radius.

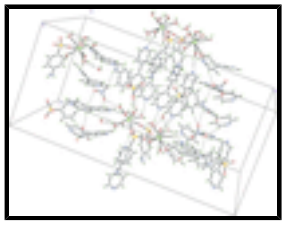

Fig. 2. The crystal packing of (I), displayed with N—H···O and O—H···O hydrogen bonds as dashed lines.

Primary atom site location: structure-invariant direct methods	Flack parameter: 0.002 (1)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 May 2010; accepted 6 June 2010

Key indicators: single-crystal X-ray study; T = 200 K; mean σ(C–C) = 0.011 Å; disorder in main residue; R factor = 0.053; wR factor = 0.118; data-to-parameter ratio = 14.7.

In the title compound, $[Ru(C_9H_{10}BN_6)Cl(C_3H_4N_2)(C_{18}H_{15}P)]$, the Ru^{II} atom is coordinated by an N,N',N''-tridentate hydridotrispyrazolylborate (Tp) ligand, a pyrazole (HPz) molecule, a chloride ion and a triphenylphosphine ligand, resulting in a distorted $RuClPN_4$ octahedral coordination for the metal ion: the tridentate N atoms occupy one octahedral face and the Cl and P atoms are *cis*. One of the phenyl rings is disordered over two orientations in a 0.547 (10):0.453 (10) ratio, and a weak intramolecular N—H···Cl hydrogen bond generates an S(5) ring.

Chlorido[hydridotris(pyrazol-1-yl-κN^2)borato](1*H*-pyrazole-κN^2)(triphenylphosphine-κP)ruthenium(II)

C.-C. Huang, H.-G. Chen, Y. H. Lo, L.-S. Hsu and C.-H. Lin

Comment

Pyrazoles and pyrazolate anions are attractive ligands that disclose a rich coordination chemistry (Deacon *et al.*, 1998). Pyrazoles and substituted pyrazoles usually perform as monodentate ligands (Lo *et al.*, 2004) and these monodentate pyrazoles may give rise to fascinating processes such as prototropic equilibrium or reversible metal-ligand binding, which are relevant to biological systems (Govind *et al.*, 1996). On the other hand, Tp (hydridotripyrazolylborate) ligand is often compared with the Cp (Cp = η^5-C_5H_5) ligand due to their charge and number of electrons donated in the formation of complex. The ruthenium chloride complex [Ru(Tp)Cl(PPh_3)$_2$] (Alcock *et al.*, 1992) has been used as the precursor for the synthesis of several complexes because of its substitutionally labile phosphines and chloride (Cheng *et al.*, 2009). TpRu complexes are of importance for stoichiometric and catalytic transformations of organic compounds (Pavlik *et al.*, 2005).

Treatment of the complex [Ru(Tp)Cl(PPh_3)$_2$] reacts with pyrazole in toluene affording the title compound [RuCl(Tp)(PPh_3)(HPz)] (Figure 1). The single crystals of the title compound suitable for X-ray structure analysis were obtained by recrystallization of the crude product from dichloromethane–ether. In the crystal structure of the title compound the ruthenium metal center is coordinated by four N, one P and one Cl atom within slightly distorted octahedron. The bite angle of the Tp ligand produces an average produces an average N—Ru—N angle of 86.6° only slightly distorted from 90°. The three Ru—N(Tp) bond lengths (2.067 (4), 2.097 (4), and 2.076 (4) Å) are slightly longer than the average distance of 2.038 Å in other ruthenium Tp complexes (Gemel *et al.* 1996; Slugovc *et al.* 1998). The Ru—Cl bond of 2.4374 (14) Å are similar to those found in other (pyrazole)ruthenium complexes, such as 2.4259 (14) Å in [Ru(Tp)Cl(PPh_3)(PhCN)] (Tong *et al.* 2008) and 2.4429 (7) Å in [Ru(Tp)Cl(PPh_3) (HN=CPh_2)] (Tong *et al.* 2009). Weak N—H——Cl hydrogen bond is observed in the crystal structure.

Experimental

To a solution of [Ru(Tp)Cl(PPh_3)$_2$] (3.95 g, 4.50 mmol) in toulene (100 ml), an excess of pyrazole were added. The mixture was heated using a warm water bath for 30 min. A deep yellow color developed during this time. The reaction mixture was stirred for a further 2 h at room temperature (298 K). Then it was concentrated to approximately half of the volume and cooled to 273 K. The yellow precipitate was filtered off, washed with ethanol and ether and dried under vacuum to give the title compound. Yellow prisms of (I) were obtained by recrystallization from dichloromethane–ether.

Refinement

The H atoms were placed in idealized positions and constrained to ride on their parent atoms, with C—H = 0.95 Å and U_{iso}(H) = 1.2 U_{eq}(C) and B—H = 1.0 Å and U_{iso}(H) = 1.2U_{eq}(B).

Figures

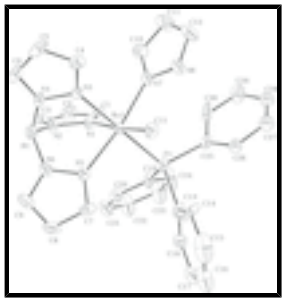

Fig. 1. Molecular structure of (I) with displacement ellipsoids drawn at the 30% probability level (H atoms are shown as spheres of arbitrary radius).

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.053$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.118$	H-atom parameters constrained

S = 1.02	$w = 1/[\sigma^2(F_o^2) + (0.0431P)^2 + 4.7477P]$ where $P = (F_o^2 + 2F_c^2)/3$
5292 reflections	$(\Delta/\sigma)_{max} = 0.001$
360 parameters	$\Delta\rho_{max} = 0.89$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.88$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 May 2010; accepted 23 May 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.047; wR factor = 0.111; data-to-parameter ratio = 11.0.

In the title compound, $C_{15}H_{14}N_2O_2$, the aromatic rings are oriented at a dihedral angle of 24.52 (5)°. The dihedral angle between the nitro group and its parent benzene ring is 9.22 (16)°. In the crystal, molecules interact through aromatic $\pi-\pi$ stacking interactions [centroid–centroid separations = 3.8158 (14) and 3.9139 (14) Å].

Related literature

2,3-Dimethyl-*N*-[(*E*)-4-nitrobenzylidene]aniline

M. I. Tariq, S. Ahmad, M. N. Tahir, M. Sarfaraz and I. Hussain

Comment

Torsional, vibration and central bond length of *N*-benzylideneanilines (Harada *et al.*, 2004) has been studied for seven compounds at different temperatures. The title compound (I, Fig. 1) is another example due to change of substitutions at both phenyl rings for which the same study can be undertaken. The title compound has been prepared for derivatization.

The molecules of (I) are essentially monomeric having no intra or inter-molecular H-bondings. The phenyl rings A (C1—C6) and B (C10—C15) are planar with r. m. s. deviation of 0.0065 and 0.0022 Å respectively. The dihedral angle between A/B is 24.52 (5)°. The nitro group C (O1/N2/O2) is oriented at 9.22 (16)° with the parent phenyl ring. It is to be noted that the nitro substituated phenyl ring B has smaller bond lengths [1.365 (3)–1.387 (3) Å], whereas the 2,3-dimethyl substituated ring has longer bond lengths 1.373 (3)—1.401 (3) Å. The value of C═N bond length at room temperature for (I) is 1.262 (3) Å which is in compatible with the studies of Harada *et al.*, 2004. The molecules are stabilized due to π—π interactions between the centroids of phenyl rings with separation of 3.8158 (14) and 3.9139 (14) Å.

Experimental

Equimolar quantities of 2,3-dimethylaniline and 4-nitro benzaldehyde were refluxed in methanol for 15 minutes resulting in yellow color precipitates. The contents of the flask were dried at room temperature and washed with methanol and ethanol, respectively. The washed crude material affoarded yellow needles of (I) in the solution of diethyl ether at room temperature by slow evaporation after 24 h.

Refinement

In the absence of anomalous scattering, all Friedal pairs were merged. Although all H-atoms were appeared in Fourier difference map but positioned geometrically (C–H = 0.93–0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C), where x =1.2 for aryl C–H and x = 1.5 methyl H-atoms.

Figures

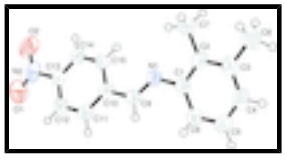

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level.

Data collection

Bruker Kappa APEXII CCD diffractometer	1917 independent reflections
Radiation source: fine-focus sealed tube	1253 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.057$
Detector resolution: 7.40 pixels mm^{-1}	$\theta_{max} = 28.6°$, $\theta_{min} = 2.2°$
ω scans	$h = -8\rightarrow9$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -15\rightarrow15$
$T_{min} = 0.986$, $T_{max} = 0.987$	$l = -20\rightarrow20$
13172 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0482P)^2 + 0.0883P]$ where $P = (F_o^2 + 2F_c^2)/3$
1917 reflections	$(\Delta/\sigma)_{max} < 0.001$
174 parameters	$\Delta\rho_{max} = 0.12$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.14$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Comment

As part of our onging studies of pyrazole derivatives (Zhu *et al.*, 2010), we now report the structure of the title compound, (I).

In the molecule of the title compound, (Fig.1) there is one molecule in the asymmetric unit. Atom O1, C7, C8, C11 and atom N3 form a plane, the largest deviation being 0.0132 (15) Å for atom C11. The dihedral angle between this plane and the pyrazolone ring of PMAP is 0.46 (4)°, indicating that they are essentially coplanar, as seen in Ethyl 2–{[(1*Z*)–(3–methyl–5–oxo–1–phenyl–4,5–dihydro–1*H*–pyrazol–4–ylidene) (*p*–tolyl)methyl]amino}–3–phenylpropanoate (1.52 (4)°; Zhang *et al.*, 2010). The bond lengths within this part of the molecular lie between classical single–and double–bond lengths, indicating extensive conjugation. Atoms N5,N4, C14, C13,C17 and O2 are also nearly coplanar, the largest deviation being 0.0417 (15) Å for atom C14.The dihedral angle between this plane and the phenyl ring of antipyrine is 47.41 (5)°, A strong intramolecular hydrogen bond N3—H3···O1 is observed (Table 1 & Fig. 1), stabilizing to an enamine–keto form.

Experimental

A mixture of HPMAP (15*m* mol) and 4-antipyrine (15*m* mol) in ethanol (100 ml) was refluxed over a steam bath for about 4 h, then the solution was cooled down to room temperature. After one day, pale yellow blocks were obtained and dried in air. The product was recrystallized from ethanol which afforded pale yellow blocks of (I).

Refinement

The N-bound H atom was located in a difference map and freely refined. All C-bound H atoms were geometrically positioned and refined using a riding model, with C—H = 0.95 Å for the aryl, 0.98 Å for the methyl H atoms. U_{iso}(H)= 1.2 U_{eq}(C) for aryl, 1.5U_{eq}(C) for methyl H atoms.

Figures

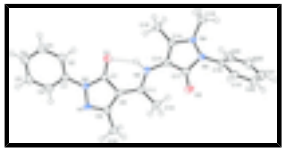

Fig. 1. The molecular structure of (I) with displacement ellipsoids drawn at the 30% probability level. H atoms are presented as spheres of arbitrary radius.

1,5-Dimethyl-4-{[1-(3-methyl-5-oxo-1-phenyl-4,5-dihydro-1*H*-pyrazol-4- ylidene)ethyl]amino}-2-phenyl-1*H*-pyrazol-3(2*H*)-one

Crystal data

$C_{23}H_{23}N_5O_2$	$F(000) = 1696$
$M_r = 401.46$	$D_x = 1.324$ Mg m^{-3}
Monoclinic, $C2/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -C 2yc	Cell parameters from 5835 reflections
$a = 20.486$ (4) Å	$\theta = 2.0$–$27.9°$
$b = 10.209$ (2) Å	$\mu = 0.09$ mm^{-1}
$c = 19.753$ (4) Å	$T = 113$ K
$\beta = 102.76$ (3)°	Block, pale yellow
$V = 4029.3$ (14) Å^3	0.20 × 0.18 × 0.12 mm
$Z = 8$	

Data collection

Rigaku Saturn CCD diffractometer	3553 independent reflections
Radiation source: rotating anode	2858 reflections with $I > 2\sigma(I)$
confocal	$R_{int} = 0.038$
Detector resolution: 7.31 pixels mm^{-1}	$\theta_{max} = 25.0°$, $\theta_{min} = 2.0°$
ω and φ scans	$h = -24\rightarrow21$
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)	$k = -11\rightarrow12$
$T_{min} = 0.983$, $T_{max} = 0.990$	$l = -23\rightarrow20$
13299 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.040$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.105$	$w = 1/[\sigma^2(F_o^2) + (0.0698P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{max} = 0.001$
3553 reflections	$\Delta\rho_{max} = 0.24$ e Å^{-3}
280 parameters	$\Delta\rho_{min} = -0.20$ e Å^{-3}
1 restraint	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0113 (7)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 25 May 2010; accepted 30 May 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.027; wR factor = 0.074; data-to-parameter ratio = 11.2.

The title compound [systematic name: 7α,12-dihydroxy-8,12-abietadiene,11,14-dione or (4b*S*,8a*S*,10*R*)-3,10-dihydroxy-2-isopropyl-4b,8,8-trimethyl-1,4,4b,5,6,7,8,8a,9,10-decahydrophenanthrene-1,4-dione], $C_{20}H_{28}O_4$, is an abietane diterpenoid, which was isolated from the roots of *Premna obtusifolia* (Verbenaceae). Its crystal structure has been reported previously [Chen *et al.* (2000). *Jiegou Huaxue*, **19**, 122–125], but the absolute configuration could not be determined using data collected with Mo radiation. This redetermination using Cu radiation shows the the absolute configurations of the stereogenic centres at positions 4b, 8a and 10 to be *S*, *S* and *R*, respectively. Two intramolecular O—H···O hydrogen bonds [one generating an *S*(5) ring and one generating an *S*(6) ring] and a number of short C—H···O contacts occur. In the crystal, molecules are linked into infinite chains propagating in [100] by O—H···O hydrogen bonds and weak C—H···O interactions.

Redetermination and absolute configuration of 7α-hydroxyroyleanone

I. A. Razak, A. W. Salae, S. Chantrapromma, C. Karalai and H.-K. Fun

Comment

The extracts of Verbenaceae plants were found to possess anti-HIV-1 integrase activity (Bunluepuech & Tewtrakul, 2009). *Premna obtusifolia* (Verbenaceae), a small tree found in the mangrove forests, is one of the Verbenaceae plants. As part of our study of chemical constituents and bioactive compounds from the roots of *Premna obtusifolia* (Verbenaceae) which were collected from Satun province in the southern part of Thailand, the title abietane diterpenoid (I) was isolated. It was known as horminone (Batista *et al.*, 1994) or 7α-hydroxyroyleanone (Nagy *et al.*, 1999) and the previous reports show that (I) exhibits significant biological activities as tumor inhibitors (Kupchan *et al.*, 1968, 1969; Jonathan *et al.*, 1989), antioxidant (Kabouche *et al.*, 2007) and antibacterial agents (Ulubelen *et al.*, 2001). The crystal structure of (I) has been reported (Chen *et al.*, 2000) but the absolute configuration could not be determined due to no large anomalous dispersion using a data set collected with Mo radiation. Our data of (I) was collected using Cu radiation with Bruker Apex-Duo CCD diffractometer and the absolute configuration at atoms C10, C5 and C7 (or positions 4b, 8a and 10 of abietane diterpenoid) were determined as *S*,*S*,*R* making use of the large anomalous scattering of Cu Kα *X*-radiation with the Flack parameter being refined to 0.13 (16). We report herein the crystal structure of (I) determined from the Cu data.

The molecule of (I) has three fused six membered rings (Fig. 1). The two cyclohexanes rings are *trans* fused. One cyclohexane ring (C1–C5/C10) is in a standard chair conformation whereas the other (C5–C10) is in half chair conformation, with the puckering parameter Q = 0.5419 (15) Å, θ = 51.68 (16)° and φ = 21.6 (2)° (Cremer & Pople, 1975). The benzoquinone ring (C8–C9/C11–C14/O2/O4) is slightly twisted with the maximum deviations of 0.060 (1) and -0.052 (1) Å for atoms C9 and C11, respectively. The O2, O3 and O4 atoms lie close to the mean plane of the C8–C9/C11–C14 ring with the *r.m.s.* of 0.0543 (1). The bond angles around C11 and C14 are indicative of sp^2 hybridization for these atoms. The orientation of the propanyl group is described by the torsion angles C14–C13–C15–C17 = -118.43 (14)° and C14–C13–C15–C16 = 116.53 (14)°. Intramolecular O1—H1O1···O4 and O3—H1O3···O2 hydrogen bonds (Table 1) generate S(6) and S(5) ring motifs, respectively (Fig. 1) (Bernstein *et al.*, 1995). The bond distances in (I) are within normal ranges (Allen *et al.*, 1987).

The crystal packing of (I) is stabilized by intermolecular O—H···O hydrogen bonds and weak C—H···O interactions (Fig. 2 and Table 1). The molecules are linked into infinite one dimensional chains along the [1 0 0] (Fig. 2) through O1—H1O1···O2 and O3—H1O3···O4 hydrogen bonds and weak C7—H7A···O2 interactions (Table 1).

Experimental

The air-dried roots of *premna obtusifolia* (4.5 kg) were extracted with CH_2Cl_2 (2 × 20 *L*) at room temperature. The combined extracts were concentrated under reduced pressure to afford a dark yellow extract (40.5 g) which was subjected to quick column chromatography (QCC) over silica gel using solvents of increasing polarity from n-hexane to EtOAc to afford 12 fractions (F1—F12). Fraction F4 was further purified by QCC using hexane-acetone (9:1), yielding the title compound (57.5 mg). Yellow blocks of (I) were recrystallized from n-hexane after several days.

Refinement

Hydroxy H atoms attached to O1 and O3 were located from the difference map and isotropically refined. The remaining H atoms were placed in calculated positions with (C—H) = 0.98 for CH, 0.97 for CH_2 and 0.96 Å for CH_3 atoms. The U_{iso} values were constrained to be $1.5U_{eq}$ of the carrier atom for methyl H atoms and $1.2U_{eq}$ for the remaining H atoms. A rotating group model was used for the methyl groups. The highest residual electron density peak is located at 0.78 Å from H7A and the deepest hole is located at 0.95 Å from C11. 970 Friedel pairs were used to determine the absolute configuration.

Figures

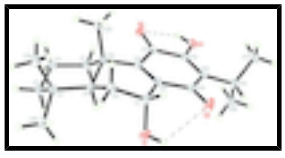

Fig. 1. The structure of (I), showing 50% probability displacement ellipsoids. Intramolecular O—H···O hydrogen bonds are shown as dashed lines.

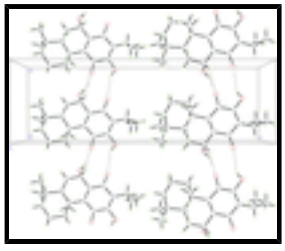

Fig. 2. The crystal packing of (I) viewed along the *b* axis, showing one dimensional chains along the [1 0 0]. Hydrogen bonds are shown as dashed lines.

(4b*S*,8a*S*,10*R*)-3,10-dihydroxy-2-isopropyl-4b,8,8-trimethyl- 1,4,4b,5,6,7,8,8a,9,10-decahydrophenanthrene-1,4-dione

0 restraints

Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites

H atoms treated by a mixture of independent and constrained refinement

$w = 1/[\sigma^2(F_o^2) + (0.0454P)^2 + 0.3997P]$ where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{max} < 0.001$

$\Delta\rho_{max}$ = 0.22 e Å^{-3}

$\Delta\rho_{min}$ = −0.13 e Å^{-3}

Absolute structure: Flack (1983), 970 Friedel pairs

Flack parameter: 0.13 (16)

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2$sigma(F^2) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 25 May 2010; accepted 29 May 2010

Key indicators: single-crystal X-ray study; T = 290 K; mean σ(C–C) = 0.005 Å; R factor = 0.054; wR factor = 0.134; data-to-parameter ratio = 13.4.

In the title compound, $C_{11}H_{10}ClNO_2\cdot H_2O$, the organic molecule is roughly planar (r.m.s. deviation = 0.074 Å). In the crystal structure, molecules are linked by O—H···O and O—H···N hydrogen bonds and weak C—H···π and π–π interactions [centroid–centroid distance = 3.578 (3) Å] consolidate the packing. A short Cl···O contact [3.147 (3) Å] is also observed.

Related literature

(2-Chloro-8-methoxyquinolin-3-yl)methanol monohydrate

S. M. Roopan, F. N. Khan, A. S. Kumar, V. R. Hathwar and M. Akkurt

Comment

The importance and general background of the title compound is given in our earler paper (Roopan *et al.*, 2009).

In the main molecule of the title compound (I), (Fig. 1), all the non-H atoms are roughly coplanar (r.m.s. deviation = 0.074 Å). The bond lengths and angles are comparable to the similar structures 2-chloro-3-hydroxymethyl-7,8-dimethylquinoline and 2-chloro-3-hydroxymethyl-6-methoxyquinoline (Khan *et al.*, 2010*a*,b), and also those in literature (Allen *et al.*, 1987).

The crystal structure is stabilized by intermolecular O—H···O and O—H···N interactions between the symmetry-related molecues (Table 1, Fig. 2). Adjacent molecules are stacked along the *b* axis through weak C—H···π interactions (Table 1) and π-π interactions [*Cg*1···*Cg*2(-*x*, 1 - *y*, -*z*) = 3.578 (3) Å, where *Cg*1 and *Cg*2 are centroids of the N1/C1–C3/C8/C9 and C4–C9 rings, respectively]. In addition a short Cl1.. O2 contact of 3.15 Å is also observed.

Experimental

2-Chloro-8-methoxyquinoline-3-carbaldehyde (222 mg, 1 mmol), sodium borohydride (38 mg, 1 mmol) and catalytic amount of montmorillonite K-10 were taken in an open vessel and the resulting mixture was irradiated at 500 W for 5 min. Ethylacetate was poured into the reaction mixture and filtered off. The filtrated after removal of solvent was subjected to column chromatography packed with silica and ethyl acetate/petroleum ether was used as the eluant. Colourless slabs of (I) were grown by solvent evaporation from a solution of the compound in chloroform.

Refinement

The H atoms of the water molecule were located in difference map and its positional parameters were refined freely [O3—H1W = 0.85 (5) and O3—H2W = 0.83 (4) Å]. The remaining H atoms were positioned geometrically, with O—H = 0.82 Å (for OH) and C—H = 0.93, 0.97 and 0.96 Å for aromatic, methylene and methyl H, respectively, and refined as riding with U_{iso}(H) = 1.2 or 1.5 U_{eq}(O, C).

Figures

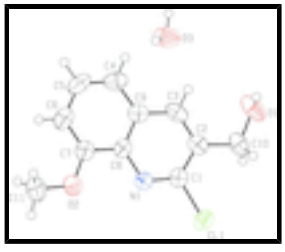

Fig. 1. The molecular structure of (I), showing 50% probability displacement ellipsoids.

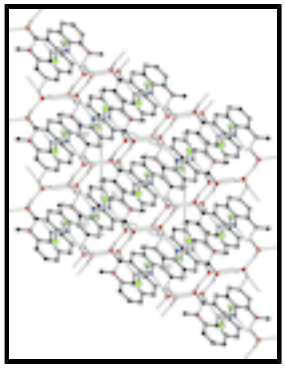

Fig. 2. Molecular packing of (I) with hydrogen bonding shown as dashed lines. The H atoms not involved in hydrogen bonds have been omitted for clarity.

(2-Chloro-8-methoxyquinolin-3-yl)methanol monohydrate

Crystal data

$C_{11}H_{10}ClNO_2 \cdot H_2O$	$F(000) = 504$
$M_r = 241.67$	$D_x = 1.456$ Mg m^{-3}
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2yn	Cell parameters from 1021 reflections
$a = 9.161$ (5) Å	$\theta = 1.9$–$20.2°$
$b = 14.246$ (5) Å	$\mu = 0.34$ mm^{-1}
$c = 9.464$ (5) Å	$T = 290$ K
$\beta = 116.819$ (5)°	Slab, colourless
$V = 1102.3$ (9) Å^3	0.31 × 0.21 × 0.10 mm
$Z = 4$	

Data collection

Oxford Xcalibur Eos (Nova) CCD detector diffractometer	2044 independent reflections
Radiation source: Enhance (Mo) X-ray Source	1212 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.100$
ω scans	$\theta_{max} = 25.5°$, $\theta_{min} = 2.9°$
Absorption correction: multi-scan (*CrysAlis RED*; Oxford Diffraction, 2009)	$h = -11 \rightarrow 11$
$T_{min} = 0.903$, $T_{max} = 0.967$	$k = -17 \rightarrow 17$
8360 measured reflections	$l = -11 \rightarrow 11$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.054$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.134$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.90$	$w = 1/[\sigma^2(F_o^2) + (0.0692P)^2]$

	where $P = (F_o^2 + 2F_c^2)/3$
2044 reflections	$(\Delta/\sigma)_{max} < 0.001$
153 parameters	$\Delta\rho_{max} = 0.40$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.26$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 25 May 2010; accepted 29 May 2010

Key indicators: single-crystal X-ray study; T = 290 K; mean σ(C–C) = 0.006 Å; R factor = 0.061; wR factor = 0.135; data-to-parameter ratio = 13.4.

The molecule of title compound, $C_{11}H_{10}ClNO$, is close to being planar (r.m.s deviation for the non-H atoms = 0.017 Å). In the crystal, molecules interact by way of O—H···O hydrogen bonds, generating $C(2)$ chains propagating in [010]. The crystal structure is consolidated by C—H···π interactions and aromatic π–π stacking interactions [centroid–centroid distance = 3.661 (2) Å].

Comment

As part of our program which aimed to develop new selective and environmentally friendly methodologies for the preparation of 2-chloroquinolines (Roopan *et al.*, 2010), we report here crystal structure of the title compound, (I).

The title molecule (I), (Fig. 1), except the hydroxyl and methyl H atoms, close to planar (r.m.s deviation 0.017 Å). The values of the geometric parameters in (I) are comparable to those of some similar structures (Khan *et al.*, 2009).

In the solid-state, the molecules are linked *via* intermolecular O—H···O hydrogen bonds (Table 1, Fig. 2). The crystal structure is further stabilized by an intermolecular C–H···π interactions between the methylene H atom of ethenol substituent and the pyridine ring of an adjacent molecule, with a C10–H10A···*Cg*1^{ii} separation of 2.75 Å (Table 1, *Cg*1 is the centroid of N1/C1–C3/C8/C9 pyridine ring; symmetry code: (ii) *x*, *y* + 1, *z*). In addition, the packing mode results in stabilizing π-π stacking interactions [*Cg*1···*Cg*2^{ii} = 3.661 (2) Å, where *Cg*1 and *Cg*2 are the centroids of the N1/C1–C3/C8/C9 and C4–C9 rings].

Experimental

2-Chloro-8-methylquinoline-3-carbaldehyde (206 mg, 1 mmol), sodium borohydride (38 mg, 1 mmol) and catalytic amount of montmorillonite K-10 were taken in an open vessel and the resulting mixture was irradiating at 500 W for 4 min. Ethylacetate was poured into the reaction mixture and filtered off. The filtrated after removal of solvent ethy lacetate was subjected to column chromatography packed with silica and ethyl acetate/petroleum ether was used as the eluant. Colourless plates of (I) were grown by solvent evaporation from a solution of the compound in chloroform.

Refinement

H atoms were positioned geometrically, with C—H = 0.93- 0.97 Å, and refined a riding model with U_{iso}(H) = 1.2 or 1.5 U_{eq}(C). The value of R_{int} [0.167] is greater than 0.12, which may reflect the poor crystal quality.

Figures

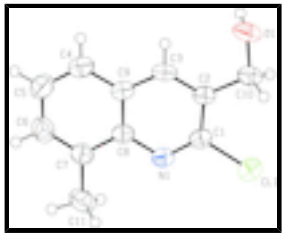

Fig. 1. The molecule of (I), showing 50% probability displacement ellipsoids.

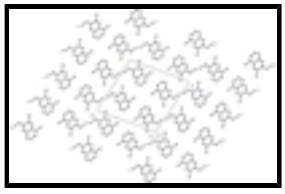

Fig. 2. A view of the packing of (I) with intermolecular O–H···O hydrogen bonding down the *b* axis. The H atoms not involved in hydrogen bonds have been omitted for clarity.

0 restraints	$\Delta\rho_{min} = -0.23$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 25 May 2010; accepted 29 May 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.007 Å; R factor = 0.085; wR factor = 0.222; data-to-parameter ratio = 13.1.

The title compound, $C_{11}H_{10}ClNO$, is close to being planar (r.m.s deviation for the non-H atoms = 0.026 Å). In the crystal, molecules are linked by O—H···O hydrogen bonds, generating $C(2)$ chains, and weak C—H···π interactions and aromatic π–π stacking interactions [centroid–centroid distance = 3.713 (3) Å] help to consolidate the sturcture.

Comment

The importance and general background of the title compound is given in our earler paper (Roopan *et al.*, 2010).

The molecule of the title compound, (I), (Fig. 1), except the hydroxyl and methyl H atoms, is close to planar (r.m.s deviation 0.026 Å).

An intramolecular C—H···O hydrogen bond generates an S(5) ring motif (Bernstein *et al.*, 1995). Molecules of (I) are linked *via* O—H···O hydrogen bonds (Table 1, Fig. 2), an intermolecular C–H···π interactions between the aromatic H atoms of the ethenol substituent and the pyridine (N1/C1/C6–C9) ring of an adjacent molecule (Table 1), and π-π stacking interactions helping to stabilize the crystal structure [*Cg*1···*Cg*2(*x*, 1 + *y*, *z*) = 3.713 (3) Å, where *Cg*1 and *Cg*2 are centroids of the N1/C1/C6–C9 and C1–C6 rings, respectively].

Experimental

2-Chloro-6-methylquinoline-3-carbaldehyde (206 mg, 1 mmol), sodium borohydride (38 mg, 1 mmol) and catalytic amount of montmorillonite K-10 were taken in an open vessel and the resulting mixture was irradiating at 500 W for 5 min. Ethylacetate was poured into the reaction mixture and filtered off. The filtrated after removal of solvent was subjected to column chromatography packed with silica and ethyl acetate/petroleum ether was used as the eluant. Colourless plates of (I) were grown by solvent evaporation from a solution of the compound in chloroform.

Refinement

The H atom of the OH group were located in difference map and its positional parameters were refined freely [O1—H1O = 0.79 (6) Å]. The other H atoms were positioned geometrically, with C—H = 0.93–0.97 Å, and refined as riding with U_{iso}(H) = 1.2 or 1.5 U_{eq}(C). The value of R_{int} [0.136] is greater than 0.12. Since the overall quality of the data may be poor due to the crystal quality.

Figures

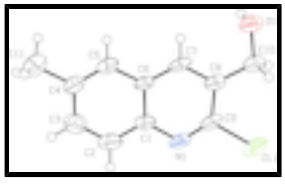

Fig. 1. View of the molecular structure of (I), showing 50% probability displacement ellipsoids.

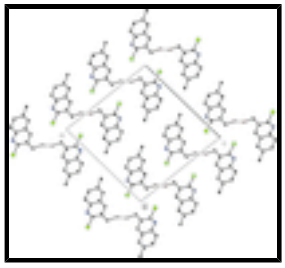

Fig. 2. Molecular packing and the hydrogen bonding of (I) viewed down *b* axis. The H atoms not involved in hydrogen bonds have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.085$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.222$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.94$	$w = 1/[\sigma^2(F_o^2) + (0.1359P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
1721 reflections	$(\Delta/\sigma)_{max} < 0.001$

131 parameters	$\Delta\rho_{max} = 0.41$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.46$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 26 May 2010; accepted 31 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.055; wR factor = 0.185; data-to-parameter ratio = 18.9.

There are two molecules in the asymmetric unit of the title compound, $C_{11}H_{14}N_2O_2$, which have similar conformations. In the crystal, the molecules are linked by N—H···O hydrogen bonds, generating $C(4)$ chains propagating in [001].

Ethyl 3-(4-methylbenzylidene)carbazate

Y.-F. Li, W.-H. Sheng and F.-F. Jian

Comment

Schiff bases bearing additional donor groups represent the important class of heteropolydentate ligands capable of forming mono-, bi-, and polynuclear complexes with metals in coordination chemistry.(Borisova, *et al.*, 2007). Meanwhile, it is an important intermediate compound which have been reported to be compounds with second-order nonlinear optical (NLO) materials (Gradinaru *et al.*, 2007). As part of our search for new schiff base compounds we synthesized the title compound (I), and describe its structure here. The title compound contains two independent molecules in the unit. The dihedral angle between the two independent benzene rings is [72.32 (11)°]. The C1A/C2A/O2A/C3A/O1A/N1A/N2A and C1B/C2B/O2B/C3B/O1B/N1B/N2B planes form dihedral angles of 4.43 (11)° and 2.33 (12)°, respectively, with the benzene planes. In the crystal lattice, the N—H···O intramolecular hydrogen bonds which form chains stable the molecule structures.

Bond lengths and angles are comparable to a related compound (Li *et al.*, 2009).

Experimental

A mixture of 4-methylbenzaldehyde (0.1 mol), and ethyl carbazate (0.1 mol) was stirred in refluxing ethanol (20 ml) for 4 h to afford the title compound (0.092 mol, yield 92%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.97 Å, and with U_{iso}=1.2–1.5U_{eq}.

Figures

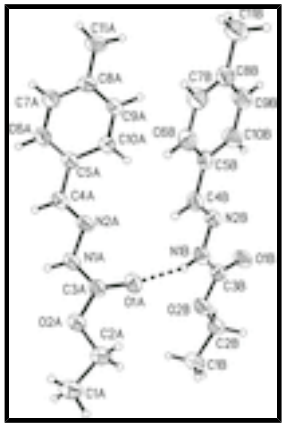

Fig. 1. The structure of (I) showing 30% probability displacement ellipsoids. The dashed line indicates a hydrogen bond.

Data collection

Bruker SMART CCD diffractometer	3927 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.037$
graphite	$\theta_{max} = 27.5°$, $\theta_{min} = 3.1°$
ω scans	$h = -19\rightarrow19$
21172 measured reflections	$k = -10\rightarrow10$
5128 independent reflections	$l = -20\rightarrow23$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.055$	H-atom parameters constrained
$wR(F^2) = 0.185$	$w = 1/[\sigma^2(F_o^2) + (0.1115P)^2 + 0.1779P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{max} < 0.001$
5128 reflections	$\Delta\rho_{max} = 0.24$ e Å^{-3}
272 parameters	$\Delta\rho_{min} = -0.30$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.064 (6)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.048; wR factor = 0.194; data-to-parameter ratio = 23.9.

The asymmetric unit of the title compound, $C_{19}H_{20}N_2O_3$, contains two molecules (*A* and *B*) with slightly different orientations of the ethyl groups with respect to the attached carboxylate groups. Intramolecular C—H···O hydrogen bonds generate S(8) ring motifs in both molecules *A* and *B*. In each molecule, the benzimidazole ring system is essentially planar, with maximum deviations of 0.023 (1) and 0.020 (1) Å, respectively, for molecules *A* and *B*. The dihedral angle between the benzimidazole ring system and the phenyl ring is 37.34 (5)° for molecule *A* and 42.42 (5)° for molecule *B*. In the crystal, O—H···N and C—H···O hydrogen bonds link the molecules into [100] columns with a cross-section of two-molecule by two-molecule wide, and further stabilization is provided by weak C—H···π and π–π interactions [centroid separations = 3.5207 (7) and 3.6314 (8) Å].

Ethyl 1-(2-hydroxyethyl)-2-*p*-tolyl-1*H*-benzimidazole-5-carboxylate

N. Arumugam, A. S. Abdul Rahim, H. A Wahab, J. H. Goh and H.-K. Fun

Comment

Benzimidazoles are known to exhibit anti-HIV (Evans *et al.*, 1997), anti-fungal (Göker *et al.*, 2002) and anti-parasitic (Seth *et al.*, 2003) activities. In particular, substituted benzimidazoles have proven as drug leads, generating pharmacological interests (Grassmann *et al.*, 2002). A series of substituted benzimidazole derivatives have been synthesised and evaluated for *in vitro* and *in vivo* anti-tumor activity and DNA binding affinity (Denny *et al.*, 1990). Due to their importance, the crystal structure determination of the title compound was carried out and the results are presented in this paper.

The asymmetric unit of the title benzimidazole compound (Fig. 1) comprises of two crystallographically independent molecules, designated *A* and *B*. A superposition of the non-H atoms of molecules *A* and *B* (Fig. 2) using *XP* in *SHELXTL* (Sheldrick, 2008), gave an r.m.s. deviation of 0.517 Å. Molecules *A* and *B* differ slightly in the orientation of the ethyl groups (C15 and C16) with respect to the attached carboxylate groups, as can be seen in Fig. 2. The torsion angles C14A–O2A–C15A–C16A and C14B–O2B–C15B–C16B are -77.41 (15) and -171.37 (10)°, respectively.

Intramolecular C1A—H1AA···O3A and C1B—H1BA···O3B hydrogen bonds generate eight-membered rings, producing *S*(8) ring motifs (Bernstein, 1995). In each molecule, the benzimidazole ring system (C7-C13/N1/N2) are essentially planar, with maximum deviations of 0.023 (1) and -0.020 (1) Å, respectively, at atoms C7A of molecule *A* and C8B of molecule *B*. In molecule *A*, the benzimidazole ring system is inclined at dihedral angle of 37.34 (5)° with the C1A-C6A phenyl ring; the respective angle for molecule *B* is 42.42 (5)°. The geometric parameters are comparable to those reported in closely related benzimidazole structures (Arumugam *et al.*, 2010*a,b,c*).

In the crystal packing (Fig. 3), intermolecular O3A—H1OA···N1B, O3B—H1OB···N1A, C12B—H12B···O3A, C15B—H15C···O1B and C18A—H18A···O1A hydrogen bonds link the molecules into columns with cross-section of two-molecule by two-molecule wide along the *a* axis. The crystal packing is further stabilized by intermolecular C17B—H17C···*Cg*1 interactions (Table 1) as well as weak π–π aromatic stacking interactions [*Cg*1···*Cg*2 = 3.5207 (7) and *Cg*3···*Cg*4 = 3.6314 (8) Å; symmetry code: x, y, z; *Cg*1 and *Cg*2 are the centroids of 4,5-dihydroimidazole rings (C7A/N1A/C8A/C13A/N2A and C7B/N1B/C8B/C13B/N2B), respectively; *Cg*3 and *Cg*4 are the centroids of C8A-C13A and C8B-C13B phenyl rings, respectively].

Experimental

A solution of ethyl-3-amino-4-(2-hydroxyethylamino) benzoate (0.5 g, 2.22 mmol) and sodium bisulfite adduct of *p*-methyl benzaldehyde (1.0 g, 4.46 mmol) in DMF was treated under microwave conditions at 403 K. The reaction mixture was then diluted in EtOAc (30 ml) and washed with H_2O (30 ml). The organic layer was collected and dried over Na_2SO_4. The solvent was removed under reduced pressure to afford the crude product, which upon recrystallisation from EtOAc, revealed the title compound as colourless crystals.

Refinement

Hydroxy H-atoms were located from the difference Fourier map and allowed to refine freely. The remaining H atoms were place in their calculated positions, with C–H = 0.93–0.97 Å and U_{iso}(H) = 1.2 or 1.5 U_{eq}(C). The rotating group model was applied for the methyl groups. The highest residual electron density peak is 0.49 Å from N2B and the deepest hole is 0.85 Å from C8B.

Figures

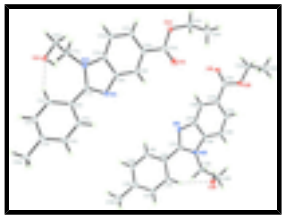

Fig. 1. The molecular structure of (I) with 50% probability displacement ellipsoids for non-H atoms. Intramolecular hydrogen bonds are shown as dashed lines.

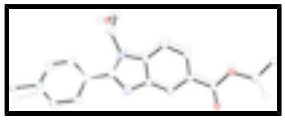

Fig. 2. Fit of molecule *A* (dashed lines) on molecule *B* (solid lines). H atoms have been omitted for clarity.

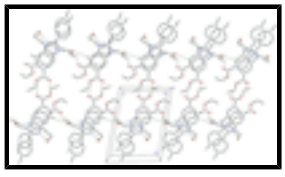

Fig. 3. The crystal packing of (I), viewed down *c* axis, showing a two-molecule by two-molecule wide column along the *a* axis. H atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

Ethyl 1-(2-hydroxyethyl)-2-*p*-tolyl-1*H*-benzimidazole-5-carboxylate

Crystal data

$C_{19}H_{20}N_2O_3$	$Z = 4$
$M_r = 324.37$	$F(000) = 688$
Triclinic, $P\overline{1}$	$D_x = 1.324$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 9.0400$ (9) Å	Cell parameters from 9690 reflections
$b = 12.6806$ (13) Å	$\theta = 2.8$–$33.8°$
$c = 15.5504$ (17) Å	$\mu = 0.09$ mm^{-1}
$\alpha = 74.170$ (2)°	$T = 100$ K
$\beta = 74.360$ (2)°	Block, colourless
$\gamma = 76.721$ (2)°	0.41 × 0.32 × 0.23 mm
$V = 1627.9$ (3) Å^3	

Data collection

Bruker APEXII DUO CCD diffractometer	10646 independent reflections
Radiation source: fine-focus sealed tube	8773 reflections with $I > 2\sigma(I)$

graphite	R_{int} = 0.030
φ and ω scans	θ_{max} = 31.5°, θ_{min} = 2.4°
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	h = −13→13
T_{min} = 0.964, T_{max} = 0.980	k = −18→18
30776 measured reflections	l = −22→22

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.048	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.194	H atoms treated by a mixture of independent and constrained refinement
S = 1.13	$w = 1/[\sigma^2(F_o^2) + (0.1301P)^2 + 0.1152P]$ where $P = (F_o^2 + 2F_c^2)/3$
10646 reflections	$(\Delta/\sigma)_{max} < 0.001$
445 parameters	$\Delta\rho_{max}$ = 0.60 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.65 e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 28 May 2010; accepted 31 May 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.004 Å; R factor = 0.037; wR factor = 0.094; data-to-parameter ratio = 8.0.

In the title compound, $C_{16}H_{17}N_3O_2\cdot0.5H_2O$, the two hydrazide molecules are approximately planar: the dihedral angles between the two substituted benzene rings are 7.7 (2) and 4.2 (2)°. Both hydrazone molecules exist in a *trans* geometry with respect to their methylidene units. In the crystal, the water molecule lies between the two organic molecules and makes bifurcated O—H···(N,O) hydrogen bonds to both of them. The hydrazide molecules form N—H···O and O—H···O hydrogen bonds, resulting in a three-dimensional network.

H. Liu

Comment

In recent years, much attention has been focused on the biological properties of hydrazone compounds (e.g. Banerjee *et al.*, 2009). A number of hydrazone compounds have been prepared and investigated for their structures (Ahmad *et al.*, 2010; Li *et al.*, 2010; Naveenkumar *et al.*, 2010; Zhang, 2009; Fun *et al.*, 2008). In the present work, a new hydrazone compound with interesting structure is reported.

The title compound consists of two hydrazone molecules and one water molecule (Fig. 1). The two hydrazone molecules are approximately parallel to each other, and are linked together by the water molecule through O—H···N and O—H···O hydrogen bonds (Table 1). Both hydrazone molecules exist in *trans* geometry with respect to the methylidene units. The dihedral angles between the two substituted benzene rings in the hydrazone molecules are 7.7 (2) and 4.2 (2)°.

In the crystal structure, the hydrazone molecules and the water molecules are linked through N—H···O, O—H···O and O—H···N hydrogen bonds (Table 1), forming a three dimensional network (Fig. 2).

Experimental

4-Dimethylaminobenzaldehyde (1.0 mmol, 149 mg) and 4-hydroxybenzohydrazide (1.0 mmol, 152 mg) were mixed in 50 ml methanol. The mixture was stirred at ambient temperature for 2 h and filtered. Colorless blocks of (I) were formed by slow evaporation of the filtrate for a week; presumably water was incorporated from the atmosphere.

Refinement

The amino hydrogen atoms were located in a difference map and refined isotropically, with the N—H distance restrained to 0.90 (1)Å. Other hydrogen atoms were placed in calculated positions (C—H = 0.93 - 0.96 Å, O—H = 0.82 Å) and refined as riding with $U_{iso}(H) = 1.2U_{eq}(C)$ and $1.5U_{eq}(O \text{ and } C_{methyl})$. In the absence of significant anomalous scattering effects, Friedel pairs were averaged.

Figures

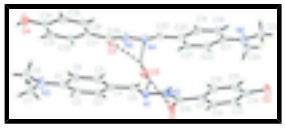

Fig. 1. Molecular structure of (I) with 30% probability displacement ellipsoids. Hydrogen bonds are shown as dashed lines.

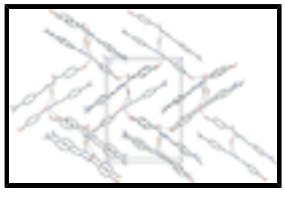

Fig. 2. Packing structure of (I), viewed along the *a* axis. Hydrogen bonds are shown as dashed lines.

$Z = 4$	

Data collection

Bruker SMART CCD diffractometer	3254 independent reflections
Radiation source: fine-focus sealed tube	2593 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.028$
ω scans	$\theta_{max} = 27.0°$, $\theta_{min} = 2.3°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -7 \rightarrow 6$
$T_{min} = 0.975$, $T_{max} = 0.976$	$k = -23 \rightarrow 23$
8336 measured reflections	$l = -9 \rightarrow 17$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.094$	$w = 1/[\sigma^2(F_o^2) + (0.0535P)^2 + 0.0137P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{max} < 0.001$
3254 reflections	$\Delta\rho_{max} = 0.13$ e Å^{-3}
407 parameters	$\Delta\rho_{min} = -0.11$ e Å^{-3}
6 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.015 (2)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 31 May 2010; accepted 1 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.010 Å; R factor = 0.032; wR factor = 0.092; data-to-parameter ratio = 11.6.

In the title compound, $[Co(C_{10}H_8N_2)_3][Mo_6O_{19}]$, the Co^{2+} cation is surrounded in a distorted octahedral coordination by six N atoms from three 2,2′-bipyridine ligands. The distribution of Mo—O bond lengths in the Lindqvist isopolyanion is consistent with other structures containing the same unit. In the crystal, the cations and anions are linked by C—H···O interactions.

Comment

There has been extensive interest in heteropolyoxometalates, owing to their fascinating properties and great potential applications in many fields such as, catalysis, material science, medicine, and magnetochemistry (Pope *et al.*, 1991). The organic amines, such as 3-(2-pyridyl)pyrazole and pyrazine, are used to effectively modify heteropolyoxomolybdates under hydrothermal condictions (Zhang, Dou *et al.*, 2009; Zhang, Wei, Sun *et al.*, 2009). Here, we describe the synthesis and structural characterization of the title compound.

As shown in Figure 1, the title compound consists of two subunits, *viz.* of a complex $[Co(C_{10}H_8N_2)_3]^{2+}$ cation, one typical Lindqvist isopolyanion $[Mo_6O_{19}]^{2-}$ anion (Dahlstrom *et al.*, 1982). The Co^{2+} cation is surrounded in a distorted octahedral coordination by six N atoms from three chelating 2,2'-bipyridine ligands. The Co—N bond lengths are in the range of 2.075 (5)—2.100 (5) Å, respectively, compared to reported one (Li & Xu, 2009).

The $[Mo_6O_{19}]^{2-}$ polyoxoanion, possessing well known Lindquist structure, is formed by six MoO_6 octahedra connected with each other through edge-sharing oxygen atoms and thus exhibits approximate Oh symmetry. Three kinds of oxygen atoms exist in the cluster, that is, terminal Oa, double-bridging oxygen Ob, and central oxygen Oc. Therefore, Mo—O band lengths can be grouped into three sets: Mo—Oa 1.669 (5)—1.682 (5) Å; Mo—Ob 1.888 (4)—1.951 (5) Å; and Mo—Oc 2.299 (4)—2.318 (4) Å; these bond distances have a rule of Mo—Oa<Mo—Ob<Mo—Oc. Comparing Mo=O bond distances with that of Lindqvist isopolyanion salt (Dahlstrom, 1982), Mo=O distances have no obvious change.

Experimental

A mixture of 2,2'-bipyridine (0.5 mmoL, 0.07 g), molybdenum(VI) oxide (1 mmol, 0.14 g), oxalic aicd (10 mmol, 0.09), *p*-carboxyphenylboronic acid (0.3 mmoL, 0.05 g), and cobalt(II) sulfate heptahydrate (0.2 mmol, 0.05 g) in 14 ml distilled water was sealed in a 25 ml Teflon-lined stainless steel autoclave and was kept at 433 K for three days. Upon cooling, red blocks of (I) were obtained. Anal. Calc. for $C_{30}H_{24}CoMo_6N_6O_{19}$: C, 25.58; H, 1.71; N, 5.97. Found: C, 22.38; H, 1.52; N, 5.78%.

Refinement

All hydrogen atoms bound to carbon were refined using a riding model with distance C—H = 0.93 Å, $U_{iso} = 1.2U_{eq}$ (C) for aromatic atoms.

Figures

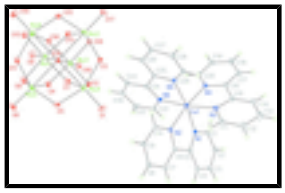

Fig. 1. The molecular structure of (I) shoiwng displacement ellipsoids drawn at the 30% probability level; H atoms are given as spheres of arbitrary radius.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.032$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.092$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.041P)^2 + 10.1791P]$ where $P = (F_o^2 + 2F_c^2)/3$
6500 reflections	$(\Delta/\sigma)_{max} = 0.003$

559 parameters

0 restraints

$\Delta\rho_{max} = 0.65$ e Å^{-3}

$\Delta\rho_{min} = -0.54$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Dibutyl 5-[(4-ethoxycarbonylphenyl)-diazenyl]benzene-1,3-dicarboxylate

Ying Liu,* Xianxi Zhang, Zechun Xue and Jian Sheng

College of Chemistry and Chemical Engineering, Liaocheng University, Liaocheng, 252059, People's Republic of China
Correspondence e-mail: yllctu@yahoo.com.cn

Received 31 May 2010; accepted 14 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.006 Å; R factor = 0.064; wR factor = 0.218; data-to-parameter ratio = 14.2.

In the title compound, $C_{25}H_{30}N_2O_6$, the dihedral angle between the aromatic rings is 3.79 (1) Å and the N=N bond shows a *trans* conformation. Both butyl side chains show evidence of disorder.

Related literature

For general background to dendrimers related to the title compound, see: Tomalia *et al.* (1990); Bosman *et al.* (1999). For a related structure, see: Wang *et al.* (2004).

Dibutyl 5-[(4-ethoxycarbonylphenyl)diazenyl]benzene-1,3-dicarboxylate

Y. Liu, X. Zhang, Z. Xue and J. Sheng

Comment

Dendrimers have been the subject of intense investigation due to both interesting structural properties and promising applications in the areas of biological and material sciences (Tomalia *et al.*, 1990; Bosman *et al.*, 1999). Here, we describe the cystallization and structural characterization of the title compound.

As shown in Fig 1. the dihedral angle between the phenyl planes of the two benzene rings is 3.79 (1) Å. The mean deviations for the two phenyl planar are 0.0058 (1) and 0.0028 (1) Å, respectively. The C=O and C—O bond distances of carbonyl groups are 1.195 (3)—1.200 (3) and 1.324 (3)—1.452 (3) Å, respectively. The N=N and N—C bond distances are 1.240 (3) and 1.423 (3)—1.431 (3) Å, respectively, which are in the normal range compared to reported Dendrimer derivatives (Wang *et al.*, 2004).

Experimental

A yellow powder of ethyl 4-((dibutyl-3',5'-biscarbonylphenyl)diazenyl)benzoate (Jinan Henghua Science & Technology Co. Ltd.) (1 mmol 0.45 g) was dissolved in 10 ml ethanol and evaporated in an open flask at room temperature. Three days later, orange blocks of (I) were obained. Anal. $C_{25}H_{30}N_2O_6$: C, 66.01; H, 6.60; N, 6.16%. Found: C, 65.98; H, 6.47; N, 6.05%.

Refinement

Hydrogen atoms were placed in geometrically calculated positions (C—H 0.95 Å for aromatic and formyl, 0.99 Å for methylene and 0.98 Å for methyl) and included in the refinement in a riding motion approximation with U_{iso}(H) = 1.2Ueq(C) [for methyl groups U_{iso}(H) = 1.5Ueq(C)].

Figures

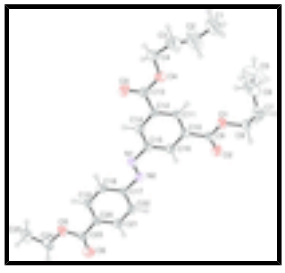

Fig. 1. The molecular sturcture of (I) with displacement ellipsoids drawn at the 30% probability level; H atoms are given as spheres of arbitrary radius.

$\gamma = 109.793$ (2)°	0.12 × 0.10 × 0.08 mm
$V = 1235.8$ (5) Å^3	

Data collection

Bruker APEXII CCD diffractometer	4275 independent reflections
Radiation source: fine-focus sealed tube	2736 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.022$
φ and ω scans	$\theta_{max} = 25.0°$, $\theta_{min} = 2.5°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2001)	$h = -10 \rightarrow 10$
$T_{min} = 0.990$, $T_{max} = 0.993$	$k = -13 \rightarrow 13$
8643 measured reflections	$l = -15 \rightarrow 16$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.064$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.218$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.1149P)^2 + 0.3064P]$ where $P = (F_o^2 + 2F_c^2)/3$
4275 reflections	$(\Delta/\sigma)_{max} < 0.001$
302 parameters	$\Delta\rho_{max} = 0.55$ e Å^{-3}
13 restraints	$\Delta\rho_{min} = -0.32$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.007 Å; R factor = 0.057; wR factor = 0.154; data-to-parameter ratio = 17.2.

The structure of the title compound, $C_{12}H_9BrN_4$, prepared by the reaction of 2-bromo-1-(6-bromo-3-pyridyl)ethanone with 2-amino-3-methylpyrazine indicates that the compound with the bromopyridyl substituent at position 2 of the imidazopyrazine fused-ring system represents the major product of this reaction. The plane of the pyridine ring forms a dihedral angle of 16.2 (2)° with the essentially planar (r.m.s. deviation = 0.006 Å) imidazopyrazine system. In the crystal, molecules are linked by weak C—H···N interactions.

2-(6-Bromo-3-pyridyl)-8-methylimidazo[1,2-*a*]pyrazine

B. Huang, E. Rui, M. Wythes, P.-P. Kung, C. Moore, A. L. Rheingold and A. Yanovsky

Comment

The reaction of 2-bromo-1-(6-bromo3-pyridyl)ethanone with 2-amino-3-methylpyrazine may potentially produce either 2- or 3-(6-bromo3-pyridyl)-8-methylimidazo[1,2-*a*]pyrazine. The present study shows that the compound with bromopyridyl substituent in position 2 of imidazopyrazine represents the major product of this reaction (Fig. 1).

The plane of the pyridine ring N1, C1—C5 forms the dihedral angle of 16.2 (2)° with the essentially planar imidazo-pyrazine system N2, N3, N4, C6—C11. Strange though it may seem, only one purely organic structure with non-protontated non-fused imidazo(1,2 - a)pyrazine system with only carbon substituents has been published heretofore (Lumma & Springer, 1981). The geometry of the bicyclic fragment in this structure is in good agreement with that of the title compound.

Experimental

A mixture of 2-bromo-1-(6-bromo-3-pyridyl)-ethanone (2.70 g, 9.68 mmol), 2-amino-3-methylpyrazine (1.06 g, 9.68 mmol), and sodium bicarbonate (1.22 g, 14.5 mmol) in 40 ml of 2-propanol was heated at 80°C overnight. After cooling down to rt, the reaction mixture was concentrated to dryness. The resulting residue was partitioned between ethyl acetate (100 ml) and water (100 ml). The organic phase was washed with brine (1 × 100 ml), dried over sodium sulfate, concentrated to dryness, and purified by column chromatography with 0 --> 5% MeOH/EA to afford the desired product as a solid (1.25 g, 44.7% yield).

Colourless needles of (I) were grown by slow evaporation of an ethanol/dichloroethane solution.

Refinement

All H atoms were placed in geometrically calculated positions (C—H 0.95 Å for aromatic and 0.98 Å for methyl H atoms, respectively) and included in the refinement in riding motion approximation. The U_{iso}(H) were set to 1.2U_{eq} of the carrying atom (1.5U_{eq} for methyl H atoms). The maximum residual density peak 1.23 e/Å^3 is located at a distance of 0.99 Å from the Br1 atom; the deepest hole -1.30 e/Å^3 is at a distance of 0.78 Å from the Br1 atom.

Figures

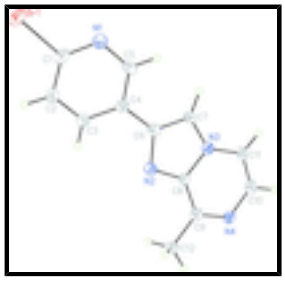

Fig. 1. Molecular structure of the title compound, showing 50% probability displacement ellipsoids. H atoms are drawn as circles of arbitrary small radius.

0 restraints	$\Delta\rho_{min} = -1.30$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

N-[(*E*)-4-Chlorobenzylidene]-2,3-dimethylaniline

M. N. Tahir, M. I. Tariq, S. Ahmad, M. Sarfraz and A. Q. Ather

Comment

In continuation to synthesize various Schiff bases (Tariq *et al.*, 2010) of 2,3-dimethylaniline, the title compound (I, Fig. 1) is being reported.

The crystal structure of *p*-chlorobenzylideneaniline (Bürgi, *et al.*, 1968), *p*-cyano-*N*-(*p*-chlorobenzylidene)aniline (Ojala *et al.*, 2001) and 4-((4-Chlorobenzylidene)amino)phenol (Kazak *et al.*, 2004) have been published which contain the chloro group at *para* position. The title compound differs from these due to substitutions at the aniline.

In (I), the 2,3-dimethylanilinic group A (C1—C8/N1) and the *p*-chlorobenzaldehyde B (C9—C15/CL1) are planar with maximum r. m. s. deviations of 0.0121 and 0.0071 Å, respectively. The dihedral angle between A/B is 51.48 (4)°. The molecules are essentially monomer with no appreciable intra-molecular H-bonding. The phenyl ring of 2,3-dimethylaniline has longer bond length [1.375 (3)–1.399 (2) Å] as compared to the phenyl ring of *p*-chlorobenzaldehyde [1.364 (4)–1.386 (3) Å]. The observed value of C═N bond is 1.264 (3) Å. All these bond lengths are compareable with 2,3-dimethyl-*N*-[(*E*)-(4-nitrophenyl)methylidene]aniline (Tariq *et al.*, 2010). The molecules are stabilized due to C—H···π interactions (Table 1). The H-atoms of the methyl at *ortho* position are disordered over two set of sites with occupancy ratio 0.60 (3):0.40 (3).

Experimental

Equimolar quantities of 2,3-dimethylaniline and 4-chlorobenzaldehyde were refluxed in methanol for 45 min resulting in yellow solution. The solution was kept at room temperature which affoarded colourless prisms of (I) after 48 h.

Refinement

All H-atoms were positioned geometrically (C–H = 0.93, 0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C), where x = 1.2 for aryl and x = 1.5 for methyl H-atoms. From the observation of difference Fourier map, it was concluded that H-atoms of one of the *ortho* methyl are disordered.

Figures

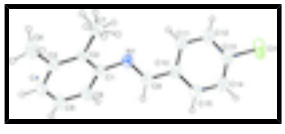

Fig. 1. View of (I) with displacement ellipsoids drawn at the 30% probability level.

N-[(*E*)-4-Chlorobenzylidene]-2,3-dimethylaniline

Crystal data

$C_{15}H_{14}ClN$	$F(000) = 512$
$M_r = 243.72$	$D_x = 1.227$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 1467 reflections
$a = 12.8981$ (4) Å	$\theta = 2.3$–$25.3°$
$b = 7.7999$ (2) Å	$\mu = 0.27$ mm^{-1}
$c = 15.0449$ (5) Å	$T = 296$ K
$\beta = 119.315$ (2)°	Prism, colourless
$V = 1319.75$ (7) Å^3	0.30 × 0.20 × 0.20 mm
$Z = 4$	

Data collection

Bruker Kappa APEXII CCD diffractometer	2378 independent reflections
Radiation source: fine-focus sealed tube	1722 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.026$
Detector resolution: 8.10 pixels mm^{-1}	$\theta_{max} = 25.3°$, $\theta_{min} = 2.7°$
ω scans	$h = -15 \rightarrow 15$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -8 \rightarrow 9$
$T_{min} = 0.939$, $T_{max} = 0.950$	$l = -18 \rightarrow 18$
10119 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.041$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.116$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0502P)^2 + 0.2848P]$ where $P = (F_o^2 + 2F_c^2)/3$
2378 reflections	$(\Delta/\sigma)_{max} < 0.001$
157 parameters	$\Delta\rho_{max} = 0.15$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.19$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.001 Å; R factor = 0.040; wR factor = 0.123; data-to-parameter ratio = 16.3.

The title compound, $C_{21}H_{23}N_3O_4$, adopts an *E* configuration about the central C=N double bond and the pyrazolone ring is almost planar, with a maximum deviation of 0.042 (1) Å. The central pyrazolone ring makes dihedral angles of 51.96 (5) and 3.82 (5)° with the attached phenyl and the trimethoxy-substituted benzene rings, respectively. The dihedral angle between the phenyl ring and the trimethoxy-substituted benzene ring is 50.19 (5)° and an intramolecular C—H···O hydrogen bond generates an S(6) ring motif. The crystal structure is stabilized by intermolecular C—H···O and C—H···N hydrogen bonds.

Comment

Compounds with the structure of AC═NB are known as Schiff base, which can be synthesized from the condensation of amino and active carbonyl groups. Schiff base compounds have shown different therapeutic properties such as antibacterial (Vukovic *et al.*, 2010), antifungal (Ramesh & Maheswaran, 2003), antitumor (Dongfang *et al.*, 2008), anti-inflammatory (Sastry & Rao, 1988) and anticancer activities (Kamel *et al.*, 2010). Due to their importance, the crystal structure determination of the title compound was carried out and the results are presented here.

In the title compound (Fig. 1), the pyrazolone ring (N1/N2/C7–C9) is almost planar, with maximum deviation of 0.042 (1) Å for atom N2. The central pyrazolone (N1/N2/C7–C9) ring makes dihedral angles of 51.96 (5)° and 3.82 (5)° with the attached phenyl ring (C1–C6) and the trimethoxy substituted phenyl ring (C11–C16), respectively. The dihedral angle between the phenyl ring(C1–C6) and the trimethoxy substituted phenyl ring (C11–C16) is 50.19 (5)°. The three methoxy groups are coplanar with the benzene ring [torsion angles C19-O2-C13-C12 = 5.04 (16)°, C20-O3-C14-C15 = -0.36 (14)° and C21-O4-C16-C15 = -1.66 (13)°].

In the crystal packing (Fig. 2), the intramolecular C10—H10A···O1 hydrogen bonding generates an *S*(6) ring motif (Bernstein *et al.*, 1995). The crystal sturcture is futher stabilized by weak intermolecular C4—H4A···O1, C20—H20C···O2, C20—H20C···O3 and C20—H20A···N3 (Table 1) hydrogen bonds.

Experimental

A mixture of 4-aminophenazone (0.50 g, 0.0033 mol) and 2,4,5-tri-methoxy- benzaldehyde (0.65 g, 0.0033 mol) in methanol (15 ml) was refluxed for 5 h with stirring to give a light yellow precipitate. It was then filtered and washed with methanol to give the pure Schiff base and yellow blocks of (I) were recrystallized from methanol. Yield: 48.18%; Mp. 381°C; IR (KBr) ν_{max} cm^{-1}: 2937 (C–H), 1644 (C═C), 1609(C═O), 1591 (C═N), 1122 (N–N). ^{1}H-NMR ($CDCl_3$) d: 10.02 ((s, 1H, CH olefinic), 7.67 (s, H3, CHaromatic), 6.49 (s, H6, CHaromatic), 7.47–7.26 (m, 5H, CHaromatic), 3.93 (s, OCH_3), 3.93 (s, OCH_3), 3.84 (s, OCH_3), 3.11(s, N-CH_3), 2.48 (s,-CH_3).

Refinement

All the H atoms were located from a difference Fourier map and refined freely [C—H = 0.945 (14)–1.008 (14) Å].

Figures

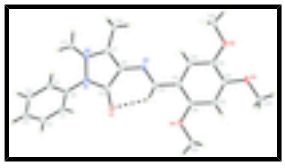

Fig. 1. The molecular structure of (I) showing 50% probability displacement ellipsoids. The intramolecular hydrogen bond is shown as a dashed line.

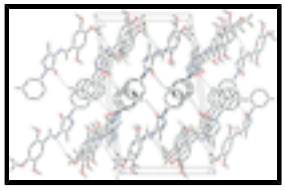

Fig. 2. The crystal packing of (I) showing hydrogen-bonded (dashed lines) networks. H atoms not involved in the hydrogen bond interactions are omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.123$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0771P)^2 + 0.3259P]$ where $P = (F_o^2 + 2F_c^2)/3$
5614 reflections	$(\Delta/\sigma)_{max} < 0.001$
345 parameters	$\Delta\rho_{max} = 0.48$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.22$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Correspondence e-mail: wajda_sta@yahoo.fr

Received 1 June 2010; accepted 2 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.048; wR factor = 0.130; data-to-parameter ratio = 41.7.

In the title hydrated salt, $C_7H_9ClN^+\cdot Cl^-\cdot 0.5H_2O$, the water O atom lies on a crystallographic twofold axis. In the crystal, the monoprotonated 4-chlorobenzylammonium cation forms N—H···Cl and N—H···O hydrogen bonds and the water molecule forms O—H···Cl hydrogen bonds, generating layers lying parallel to the *bc* plane.

(4-Chlorophenyl)methanaminium chloride hemihydrate

S. Souissi, W. Smirani Sta, S. S. Al-Deyab and M. Rzaigui

Comment

Derivatives of benzylamine were found to be competitive inhibitors of the proteolytic enzymes trypsin, plasmin, and thrombin. So, the 4-chlorobenzylamine is a strong thrombin inhibitor but only of low effectiveness against trypsin and plasmin for the hydrolysis of N-α-benzoyl catalyzed by these three enzymes. Relations between the chemical structure and the activity against trypsin, plasmin and thrombin were deduced by comparing the inhibitor constants (Markwardt, F. *et al.*, 2005). In this work, we report the crystal structure of the title compound (I). As shown in (Fig.1), the asymmetric unit of (I) is built up from one 4-chlorobenzylammonium cation, one chloride anion and one water molecule. The Cl^- anions, water molecules and R—NH_3^+ groups are lineked *via* O—H···Cl, N—H···O and N—H···Cl hydrogen bonds and ionic interactions, so as to built inorganic layers spreading around the (b,c) planes. The 4-chlorobenzylammonium cations are anchored onto the successive inorganic layers *via* hydrogen bonds and electrostatic interactions, to composite their negative charges.

The examination of the organic cation shows that the values of N—C, C—C, C—Cl distances and N—C—C, C—C—C, C—C—Cl angles range from 1.376 (3) to 1.736 (3) Å and 115.72 (19) to 122.80 (19)°, respectively. These values show no significant difference from those obtained in other organic materials associated with the same organic groups (Dhaouadi, H. *et al.*, 2008).

In this structure, the water molecules play a very important role in the cohesion of the various groups. It participates with the organic cations and chloride anions in the H-bonding scheme of N—H···O and O—H···Cl interactions in the crystal structure. The four hydrogen bonds are relatively weak, and their donor acceptor distances vary from 2.866 (2) to 3.417 (3) Å. Thus, these different interactions (hydrogen bonds, Van der Waals, and electrostatic) form a stable three-dimensional network.

Experimental

An ethanolic solution of 4-chlorobenzylamine (10 mmol, in 10 ml) was added, with stirring, to 20 ml of an aqueous HCl solution (0.5*M*) at room temperature. Colourless blocks of (I) were obtained on slow evaporation of the solvent.

Refinement

All H atoms were positioned geometrically and treated as riding on their parent atoms, [N–H = 0.89, C–H =0.96 Å (CH_3) with with U_{iso}(H) = 1.5Ueq and C–H =0.96 Å (Ar–H), with U_{iso}(H) = 1.5Ueq], but those attached to oxygen atom are located in a difference map

Figures

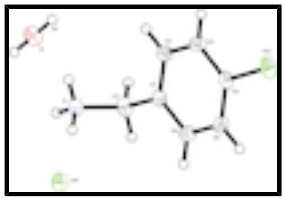

Fig. 1. View of (I) with displacement ellipsoids for non-H atoms are drawn at the 30% probability level.

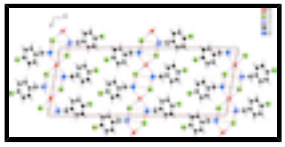

Fig. 2. A view of the packing of (I) along the *b* axis.

2217 reflections with $I > 2\sigma(I)$	intensity decay: 5%

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.048$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.130$	$w = 1/[\sigma^2(F_o^2) + (0.0585P)^2 + 0.2911P]$

	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{max} = 0.001$
4207 reflections	$\Delta\rho_{max} = 0.34$ e Å^{-3}
101 parameters	$\Delta\rho_{min} = -0.32$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0080 (12)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Y.-F. Li, J.-H. Jiang and F.-F. Jian

Comment

Schiff bases derivatives have attracted much attention due to their pharmacological activity (Ren *et al.*, 2002). As part of an investigation of the properties of Schiff bases functioning as ligands, we synthesized the title compound (I), and describe its structure here. The title compound contains two independent molecules in the unit. The dihedral angle between the aromatic rings is [23.33 (16)°]. In the crystal lattice, the N—H···O and O—H···O intramolecular hydrogen bonds which form the molecule structures.

Bond lengths and angles are comparable to those in a related compound (Li *et al.*, 2009).

Experimental

A mixture of 4-methylbenzaldehyde (0.1 mol), and thiophene-2-carbohydrazide (0.1 mol) was stirred in refluxing ethanol (20 ml) for 4 h to afford the title compound (0.092 mol, yield 92%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.97 Å, and with U_{iso}=1.2–1.5U_{eq}.

Figures

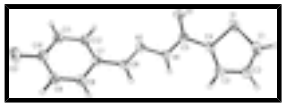

Fig. 1. The structure of (I) showing 30% probability displacement ellipsoids.

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.027; wR factor = 0.065; data-to-parameter ratio = 16.5.

In the title molecular salt, $NH_4^+\cdot C_{10}H_{14}BrO_4S^-$, the norbornane skeleton of the anion is composed of two five-membered rings in envelope conformations and a six-membered ring with one Br atom, one carbonyl O atom and a methyl group held in a boat conformation by a bridging methylene group. Short intramolecular C—H···O and C—H···Br interactions occur. In the crystal, the component ions are linked by intermolecular N—H···O and C—H···O hydrogen bonds.

Ammonium [(1*S*)-(*endo*,*anti*)]-(-)-3-bromocamphor-8-sulfonate

M. A. Abbasi, Aziz-ur-Rehman, M. Akkurt, M. Jahangir, S. W. Ng and I. U. Khan

Comment

3-Bromocamphor-8-sulfonic acid and its ammonium salts have extensively been used as chiral auxillaries for the optical resolution of a number of enantiomeric amines through diasteriomeric salt formation (Bálint *et al.*, 1999; Zhao *et al.*, 2002; Roy *et al.*, 2009; Pellati *et al.*, 2010).

In the bicyclo[2.2.1]heptane (norbornane) skeleton of the title compound, (I), (Fig. 1), the two five-membered rings have envelope conformations, with atom C2 displaced by 0.365 (3) Å from the C2–C6 plane [the puckering parameters (Cremer & Pople, 1975) are Q_2 = 0.573 (3) Å and φ_2 = 5.3 (3)°] and by 0.397 (3) Å from the C2/C3/C6/C9/C10 plane [the puckering parameters: Q_2 = 0.615 (3) Å and φ_2 = 181.6 (3)°] and the six-membered ring (C3–C6/C9/C10) adopts a boat conformation by the puckering parameters Q_T = 0.970 (3) Å, θ = 92.03 (18)° and φ = 357.34 (19) °.

In (I), the C—C single-bond lengths range from 1.491 (5) to 1.575 (4) Å, with a mean value of 1.535 (4) Å. In the bicyclo[2.2.1]heptane fragment, the angles between planes A (C3/C2/C6), B (C3–C6) and C (C3/C6/C9/C10) are as follows: A/B= 53.65 (19)°, A/C= 58.14 (18)° and B/C= 68.22 (13)°.

In the crystal, adjacent molecules of (I) are linked by intermolecular N—H···O and C—H···O hydrogen bonds (Table 1, Fig. 2).

Experimental

3-Bromocamphor-8-sulfonic acid ammonium salt was prepared by modification in the reported method (Smith *et al.*, 2008). 3-Bromocamphor-8-sulfonic acid (1 g) was dissolved in 15 ml of ethanol and then 6 ml of NH_3 solution were added. The mixture was stirred until a clear solution was observed (about 20 min). The solution was slowly concentrated on water bath to half the volume over a 2 h period. The concentrate was allowed to crystallize undisturbed for 48 h. The resulting colourless prisms of (I) were carefully separated by filteration and washed with three 0.5-ml portions of petroleum ether.

Refinement

In the ammonium ion, H atoms bound to N atoms were located in difference Fourier maps and their positional parameters were refined freely using a *DFIX* instruction [N—H = 0.93 (3) Å] in *SHELXL97*, with U_{iso}(H) = 1.5U_{eq}(N). H atoms bound to C atoms were placed in idealized positions and refined using a riding model with C—H = 0.96, 0.97 and 0.98 Å for CH_3, CH_2 and CH, respectively. U_{iso}(H) values were set at 1.5U_{eq}(C) for the methyl groups, and 1.2$U_{eq}U_{eq}$(C) for other H atoms.

Figures

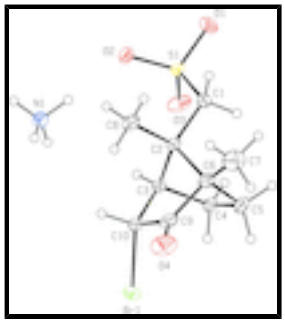

Fig. 1. View of (I) with displacement ellipsoids drawn at the 30% probability level.

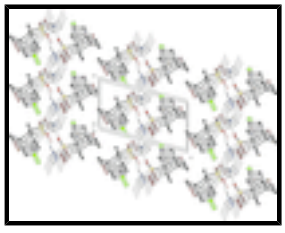

Fig. 2. The crystal packing of (I) viewed down the *b*-axis. The hydrogen-bonds are drawn as a dashed lines. H-atoms not involved in hydrogen bonds have been omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.027$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.065$	$w = 1/[\sigma^2(F_o^2) + (0.033P)^2 + 0.1814P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{max} < 0.001$
2775 reflections	$\Delta\rho_{max} = 0.35$ e Å^{-3}
168 parameters	$\Delta\rho_{min} = -0.47$ e Å^{-3}
5 restraints	Absolute structure: Flack (1983), 1155 Freidel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: −0.021 (7)

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 4 June 2010; accepted 5 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.006 Å; R factor = 0.069; wR factor = 0.182; data-to-parameter ratio = 13.1.

In the title compound, $C_{12}H_{10}N_2O_2$, the dihedral angle between the benzene ring and the furan ring is 24.6 (2)°. In the crystal, molecules are linked by N—H···O hydrogen bonds, generating $C(4)$ chains propagating in [010].

N'-Benzylidenefuran-2-carbohydrazide

Y.-F. Li and F.-F. Jian

Comment

Metal complexes based on Schiff bases have attracted much attention because they can be utilized as effective ligands to form the compounds with optically active (Polt *et al.*, 2003). As part of our search for new Schiff base compounds we synthesized the title compound (I), and describe its structure here. The dihedral angle between the benzene ring and the furan ring is 24.6 (2)°. In the crystal lattice, the N—H···O hydrogen bonds which form chains stable the molecule structures.

Bond lengths and angles are comparable to those in a related material (Jiang, 2010).

Experimental

A mixture of benzaldehyde (0.1 mol), and furan-2-carbohydrazide (0.1 mol) was stirred in refluxing ethanol (20 ml) for 2 h to afford the title compound (0.096 mol, yield 96%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.97 Å, and with U_{iso}=1.2–1.5U_{eq}.

Figures

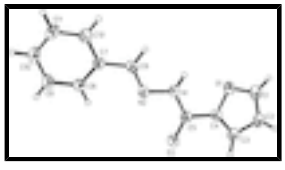

Fig. 1. The structure of (I) showing 30% probability displacement ellipsoids.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)]$ = 0.069	H-atom parameters constrained
$wR(F^2)$ = 0.182	$w = 1/[\sigma^2(F_o^2) + (0.0916P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
S = 0.87	$(\Delta/\sigma)_{max} < 0.001$
1915 reflections	$\Delta\rho_{max}$ = 0.48 e Å^{-3}
146 parameters	$\Delta\rho_{min}$ = −0.35 e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.042 (4)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 6 June 2010; accepted 6 June 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.009 Å; R factor = 0.077; wR factor = 0.224; data-to-parameter ratio = 18.0.

In the title compound, $[Mn(NCS)_2(C_{17}H_{20}N_4)]$, the Mn^{II} atom is six-coordinated by the *N*,*N*′,*N*″,*N*‴-tetradentate Schiff base ligand and by two *trans*-N atoms from two thiocyanate anions, forming a distorted octahedral geometry. The dihedral angle between the aromatic rings of the Schiff base is 9.5 (3)°.

Comment

Metal complexes with Schiff bases have been known since 1840 but only one complex derived from 1,2-bis(2'-pyridylmethyleneamino)propane has been reported (Ouyang *et al.*, 2002). In this paper, the title new manganese(II) complex is reported.

In the title complex, Fig. 1, the Mn^{II} atom is six-coordinated by four N atoms of the Schiff base ligand 1,2-bis(2'-pyridylmethyleneamino)propane, and by two N atoms from two thiocyanate ligands, forming a distorted octahedral geometry. The coordinate bond lengths (Table 1) are comparable with those observed in other similar manganese(II) complexes with Schiff bases (Louloudi *et al.*, 1999; Sra *et al.*, 2000; Karmakar *et al.*, 2005; Deoghoria *et al.*, 2005).

Experimental

The Schiff base ligand 1,2-bis(2'-pyridylmethyleneamino)propane was synthesized according to the literature method (Gourbatsis *et al.*, 1990). To a stirred methanol solution of the Schiff base ligand (1.0 mmol, 0.280 g) was added a methanol solution of manganese acetate (1.0 mmol, 0.245 g) and ammonium thiocyanate (1.0 mmol, 0.076 g). The mixture was boiled under reflux for 2 h, then cooled to room temperature. Brown blocks of (I) were formed after slow evaporation of the solution in air for a few days.

Refinement

Hydrogen atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C–H distances of 0.93–0.97 Å, and with U_{iso}(H) set at 1.2U_{eq}(C) and 1.5U_{eq}(C_{methyl}).

Figures

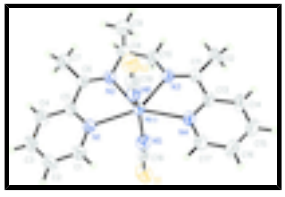

Fig. 1. The molecular structure of (I), showing displacement ellipsoids drawn at the 30% probability level.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.077$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.224$	H-atom parameters constrained
$S = 0.99$	$w = 1/[\sigma^2(F_o^2) + (0.1044P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
4608 reflections	$(\Delta/\sigma)_{max} < 0.001$
256 parameters	$\Delta\rho_{max} = 0.68$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.34$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 6 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.006 Å; R factor = 0.065; wR factor = 0.268; data-to-parameter ratio = 13.5.

In the title Schiff base compound, $C_{20}H_{18}N_4O_4$, the conformation along the bond sequence linking the benzene and quinoline rings is *trans*–(+)*gauche*–*trans*–*trans*–(+)*gauche*–*trans*–*trans*. The dihedral angle between the aromatic ring systems is 80.3 (6)°. In the crystal, a pair of intermolecular N—H···N hydrogen bonds link the molecules into centrosymmetric $R_2^2(20)$ dimers, which are aggregated *via* π–π interactions into sheets [quinoline–benzene ring centroid–centroid separation = 3.572 (2)–3.773 (3) Å].

Comment

In this article, we present the synthesis and crystal structure of a new Schiff base, (I), which contains oxygen and nitrogen donors and flexible aliphatic spacers. A closely related structure with the nitro group at the 4-position was reported recently (XiaHou *et al.*, 2010). X-ray diffraction analysis reveals that (I) contains a *trans*-(+)*gauche*-*trans*-*trans*-(+)*gauche*-*trans*-*trans* conformation along the quinoline ring–benzene ring bond sequence [torsion angles (°): C8–O1–C10–C11, 178.5 (3); O1–C10–C11–C12, 70.1 (4); C10–C11–C12–C13, -173.2 (3); C11–C12–C13–N2, -174.8 (3); C12–C13–N2–N3, 0.8 (5); C13–N2–N3–C14, -176.8 (3); N2–N3–C14–C15, -180.0 (3)] (Fig.1). The bond lengths and angles in (I) are in good agreement with the expected values (Allen *et al.*, 1987). The C14—N3 and C13—O2 bond length of 1.276 (5) and 1.214 (4) Å, respectively, indicate the presence of a typical C═N and C═O. The C═N–N angle of 116.6 (3) ° is significantly smaller than the ideal value of 120 ° expected for sp^2-hybridized N atoms. This is probably a consequence of repulsion between the nitrogen lone pairs and the adjacent N atom (Zheng *et al.*, 2006). In the crystal structure, a pair of intermolecular N—H···N hydrogen bonds link the molecules into centrosymmetric cyclic $R^2_2(20)$ (Bernstein *et al.*, 1995) dimers(Fig.2) which are aggregated *via* π–π interactions into parallel sheets [quinoline–benzene ring centroid separation = 3.572 (2)–3.773 (3) Å], giving a supramolecular two dimensional network(Fig. 3).

Experimental

The title compound was synthesized according to the method of Zheng *et al.* (2006): 4-(quinolin-8-yloxy)butanehydrazide (0.01 mol), 3-nitrobenzaldehyde (0.01 mol), ethanol (40 ml) and some drops of acetic acid were added to a 100 ml flask and refluxed for 6 h. After cooling to room temperature, the solid product was separated by filtration. Yellow blocks of (I) were obtained by slow evaporation of a tetrahydrofuran solution of the title compound over a period of six days.

Refinement

All H atoms were placed in idealized positions (C—H = 0.93–0.97 Å, N—H = 0.86 Å and refined as riding atoms with U_{iso}(H) = 1.2U_{eq}(C or N).

Figures

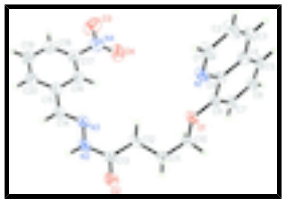

Fig. 1. The molecular structure of (I), with displacement ellipsoids at the 30% probability level.

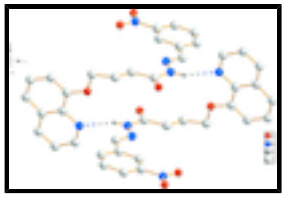

Fig. 2. The cyclic hydrogen-bonded dimer in (I) with hydrogen bonds shown as dashed lines. H atoms, except for those involved in hydrogen bonds, are not included.

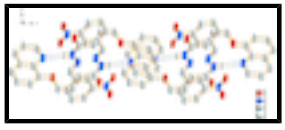

Fig. 3. Part of the crystal structure of (I) showing hydrogen bonds as dashed lines. H atoms, except for those involved in hydrogen bonds, are not included.

Data collection

Bruker SMART CCD diffractometer	3409 independent reflections
Radiation source: fine-focus sealed tube	1926 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.023$
φ and ω scans	$\theta_{max} = 25.1°$, $\theta_{min} = 1.8°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -9 \rightarrow 9$
$T_{min} = 0.983$, $T_{max} = 0.986$	$k = -12 \rightarrow 11$
5434 measured reflections	$l = -13 \rightarrow 12$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.065$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.268$	H-atom parameters constrained
$S = 1.08$	$w = 1/[\sigma^2(F_o^2) + (0.1425P)^2 + 0.1889P]$

	where $P = (F_o^2 + 2F_c^2)/3$
3409 reflections	$(\Delta/\sigma)_{max} < 0.001$
253 parameters	$\Delta\rho_{max} = 0.45$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.26$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 6 June 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.036; wR factor = 0.087; data-to-parameter ratio = 20.0.

The title compound, $(C_8H_{12}NO)(C_{16}H_{18}NO_2)[ZnCl_4]\cdot H_2O$, was obtained as a by-product of the Zn^{2+} and HCl catalyzed condensation of (2-methoxyphenyl)methanamine in water. Both cations feature an intramolecular N—H···O hydrogen bond. In the crystal, the components are linked by an extensive three-dimensional network of N—H···O, O—H···Cl and N—H···Cl hydrogen bonds (three of them bifurcated). Weak C—H···O interactions also occur.

Related literature

For related *meta*-chlorido complexes, see: Ben Gharbia *et al.* (2005, 2008). For Zn—Cl distances and Cl—Zn—Cl bond angles, see: Gayathri *et al.* (2008); Hosseinian & Mahjoub (2009).

(2-Methoxybenzyl)(2-methoxybenzylidene)azanium (2-methoxyphenyl)methanaminium tetrachloridozincate(II) monohydrate

M. El Glaoui, E. Jeanneau, M. Zeller, F. Lefebvre and C. Ben Nasr

Comment

As a part of our ongoing investigations in molecular salts containing *meta*-chlorido complexes (Ben Gharbia *et al.*, 2005; Ben Gharbia *et al.*, 2008), we report here the crystal structure of one such compound, $(C_{16}H_{18}NO_2)(C_8H_{12}NO)[ZnCl_4].H_2O$. The title compound was obtained as a byproduct of the Zn^{2+} and HCl catalyzed condensation of (2-methoxyphenyl) methanamine in water. Subsequent crystallization from the reaction mixture yielded among the main reaction products crystals of the title compound that consist of one *N*-(2-methoxybenzylidene)-1-(2-methoxyphenyl)methanaminnium cation, one (2-methoxyphenyl) methanaminium cation, one $ZnCl_4^{2-}$ anion and one interstitial water molecule (Fig. 1).

The distance N1—C9 [1.273 (2) Å] is substantially shorter than the one of N1—C8 [1.477 (2) Å], indicating the presence of a double bond in the condensation product, thus indicating the nature of the organic molecules in the crystal as indictated in Scheme 1. Preliminary NMR data on the material indicate that the bulk of the reaction product is not identical with the title compound. Further investigations into the nature of the bulk material are under way.

The Cl—Zn—Cl bond angles in the title compound show relatively little distortion from a regular tetrahedron [spread values 104.45 (3)–111.78 (2)] (Gayathri *et al.*, 2008, Hosseinian *et al.*, 2009). Classic N—H···O, O—H···Cl and N—H···Cl hydrogen bonds are observed, which link the two types of organic ammonium cations, the anionic complexes $[ZnCl_4]^{2-}$ and the uncoordinated water molecules into a 3-D hydrogen bonded network, as shown in Fig. 2. Three of the hydrogen bonds are bifurcated: N1—H1··· (Cl2,O2), N2—H2A···(O3,O4) and N2—H2B···(O4,Cl3).

Experimental

An aqueous solution of (2-methoxyphenyl) methanamine (2-methoxybenzylamine), zinc chloride and 1 *M* hydrochloric acid in a Petri disk was slowly evaporated at room temperature. A colourless block of (I), which remained stable under normal conditions of temperature and humidity, was isolated as a byproduct of the reaction.

Refinement

C—H and ammonium H atoms were placed in calculated positions with C—H in the range 0.93–0.97 and N—H equal to 0.89 Å. The imminium and the water hydrogen atom postitions were refined with N—H and O—H distance restraints of 0.89 (2) and 0.82 (2) Å. The U_{iso}(H) values of all H atoms were constrained to 1.2 or 1.5 times U_{eq} of the respective parent atom.

Figures

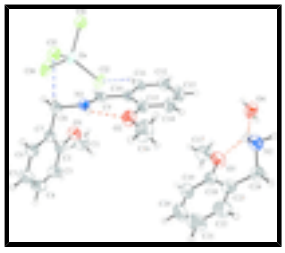

Fig. 1. A view of the title compound, showing 50% probability displacement ellipsoids (arbitrary spheres for the H atoms).

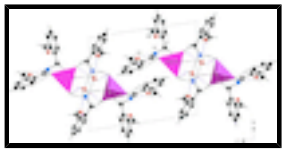

Fig. 2. Projection of the structure along the *a* axis. Hydrogen bonds are denoted by dotted lines.

(2-Methoxybenzyl)(2-methoxybenzylidene)azanium (2-methoxyphenyl)methanaminium tetrachloridozincate(II) monohydrate

Crystal data

$(C_8H_{12}NO)(C_{16}H_{18}NO_2)[ZnCl_4]\cdot H_2O$	$Z = 2$
$M_r = 619.69$	$F(000) = 640$
Triclinic, $P\overline{1}$	$D_x = 1.422$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71069$ Å
$a = 8.0884$ (9) Å	Cell parameters from 5313 reflections
$b = 12.424$ (2) Å	$\theta = 3.0$–$29.2°$
$c = 14.678$ (2) Å	$\mu = 1.25$ mm^{-1}
$\alpha = 98.23$ (1)°	$T = 293$ K
$\beta = 97.43$ (1)°	Block, colourless
$\gamma = 90.29$ (1)°	0.54 × 0.47 × 0.25 mm
$V = 1447.1$ (3) Å^3	

Data collection

Oxford Diffraction Xcalibur diffractometer	6583 independent reflections
Radiation source: fine-focus sealed tube	4644 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.028$
ω scans	$\theta_{max} = 29.5°$, $\theta_{min} = 3.0°$
Absorption correction: analytical (*CrysAlis PRO*; Oxford Diffraction, 2009; Clark & Reid, 1995)	$h = -10 \rightarrow 11$
$T_{min} = 0.576$, $T_{max} = 0.749$	$k = -15 \rightarrow 16$
12584 measured reflections	$l = -19 \rightarrow 19$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.087$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0435P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
6583 reflections	$(\Delta/\sigma)_{max} = 0.001$
329 parameters	$\Delta\rho_{max} = 0.72$ e Å^{-3}
3 restraints	$\Delta\rho_{min} = -0.64$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

N′-(4-Cyanobenzylidene)furan-2-carbohydrazide monohydrate

Yu-Feng Li and Fang-Fang Jian*

Microscale Science Institute, Department of Chemistry and Chemical Engineering, Weifang University, Weifang 261061, People's Republic of China
Correspondence e-mail: liyufeng8111@163.com

Received 7 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.048; wR factor = 0.135; data-to-parameter ratio = 15.7.

In the title compound, $C_{13}H_9N_3O_2\cdot H_2O$, the dihedral angle between the aromatic rings is 10.7 (4)° and an intramolecular N—H···O hydrogen bond occurs. In the crystal, the components are linked by N—H···O, O—H···N and O—H···O hydrogen bonds.

N'-(4-Cyanobenzylidene)furan-2-carbohydrazide monohydrate

Y.-F. Li and F.-F. Jian

Experimental

A mixture of 4-formylbenzonitrile (0.1 mol), and furan-2-carbohydrazide (0.1 mol) was stirred in refluxing ethanol (20 mL) for 2 h to afford the title compound (0.090 mol, yield 90%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.97 Å, and with U_{iso}=1.2–1.5U_{eq}.

Figures

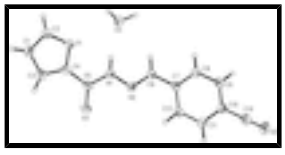

Fig. 1. The structure of the title compound showing 30% probability displacement ellipsoids.

N'-(4-Cyanobenzylidene)furan-2-carbohydrazide monohydrate

Crystal data

$C_{13}H_9N_3O_2·H_2O$	$F(000)$ = 536
M_r = 257.25	D_x = 1.379 Mg m^{-3}
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, λ = 0.71073 Å
Hall symbol: -P 2yn	Cell parameters from 1568 reflections
a = 7.0501 (14) Å	θ = 2.7–25.5°
b = 14.295 (3) Å	μ = 0.10 mm^{-1}
c = 12.640 (3) Å	T = 293 K
β = 103.38 (3)°	Block, colorless
V = 1239.3 (4) Å^3	0.22 × 0.20 × 0.18 mm
Z = 4	

Data collection

Bruker SMART CCD diffractometer	1568 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	R_{int} = 0.043
graphite	θ_{max} = 27.5°, θ_{min} = 3.3°

φ and ω scans	$h = -8 \rightarrow 9$
11389 measured reflections	$k = -18 \rightarrow 18$
2834 independent reflections	$l = -16 \rightarrow 16$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.048$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.135$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0694P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2834 reflections	$(\Delta/\sigma)_{max} < 0.001$
180 parameters	$\Delta\rho_{max} = 0.24$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.16$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 9 June 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.041; wR factor = 0.103; data-to-parameter ratio = 18.2.

In the title compound, $C_7H_6ClNO_2$, the nitro group is almost coplanar with the aromatic ring [dihedral angle = 2.9 (2)°], but the Cl atom deviates from the ring plane by 1.129 (1) Å. In the crystal, molecules are linked by weak C—H···O interactions to generate chains.

1-Chloromethyl-4-nitrobenzene

Aziz-ur-Rehman, A. Yasir, M. Akkurt, M. A. Abbasi, M. Jahangir and I. U. Khan

Comment

The irreversible binding of the reductive intermediates of nitroaromatic compounds to protein and DNA is thought to be responsible for the carcinogenicity and mutagenicity of this class of compounds. Several studies revealed that some nitro radical metabolites with special features are expected to decompose to form neutral carbon-centered free radicals with not net reduction of the nitro group occurring. The radicals anions of *p*-and *o*-nitrobenzyl chloride are known to expel chloride to form the corresponding carbon-centered nitrobenzyl radicals with rate constants of 1 × 104 and 4 × 103 s^{-1}. Such species are highly reactive and could account for the unusual cytotoxicity of these nitrocompounds (Moreno *et al.*, 1986). This structural report on 1-(chloromethyl)-4-nitrobenzene (*p*-nitrobenzyl chloride) might be helpful to carry out such studies on these nitroaromatic compounds in future.

The title molecule (I), (Fig. 1), is non-planar and the dihedral angle between the plane of the NO_2 group and benzene (C1–C6) ring is 2.9 (2)°, while the C5—C4—C7—Cl1 torsion angle is 83.8 (2)°. In (I), the bond lengths (Allen *et al.*, 1987) and angles have values within the normal ranges.

In the crystal structure, there is no classic hydrogen bonds. A weak intermolecular C—H···O interaction contrubutes to the stability of the structure (Table 1, Fig. 2).

Experimental

The title *p*-nitrobenzyl chloride was prepared by adding 5.3 ml of benzyl chloride slowly and with stirring to 27.5 ml of a mixture of equal parts of concentrated nitric and sulfuric acids cooled to 283 K. The temperature rose to 303 K during the 10 min required for the addition. The mixture was stirred for 30 min and then poured into 50 g of crushed ice. The crude material was recrystallized from ethanol. Product obtained was dissolved in ethanol and crystallized by slow evaporation of the solvent to yield colourless needles of (I) in an over-all yield of 46% (Livermore & Sealock, 1947).

Refinement

H atoms were positioned geometrically (C—H = 0.93 and 0.97 Å) and allowed to ride on their parent atoms, with U_{iso}(H) = 1.2U_{eq}(C).

Figures

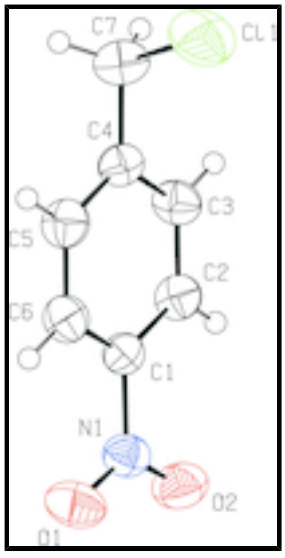

Fig. 1. View of the title molecule, with displacement ellipsoids drawn at the 50% probability level.

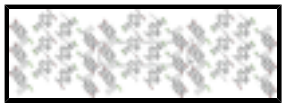

Fig. 2. The crystal packing and the hydrogen bonding of (I) viewed down the *a*-axis. H-atoms not involved in hydrogen bonds have been omitted for clarity.

1-Chloromethyl-4-nitrobenzene

Crystal data

$C_7H_6ClNO_2$	$F(000) = 352$
$M_r = 171.58$	$D_x = 1.501$ Mg m^{-3}
Orthorhombic, $P2_12_12_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2ac 2ab	Cell parameters from 1957 reflections
$a = 4.7434$ (1) Å	$\theta = 3.3$–$26.7°$
$b = 6.4189$ (2) Å	$\mu = 0.45$ mm^{-1}
$c = 24.9413$ (11) Å	$T = 296$ K
$V = 759.40$ (4) Å^3	Needle, colourless
$Z = 4$	0.35 × 0.11 × 0.10 mm

Data collection

Bruker APEXII CCD diffractometer	1586 reflections with $I > 2\sigma(I)$
Radiation source: sealed tube	$R_{int} = 0.018$
graphite	$\theta_{max} = 28.3°$, $\theta_{min} = 3.3°$
φ and ω scans	$h = -5 \rightarrow 6$
4389 measured reflections	$k = -8 \rightarrow 5$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.041$	H-atom parameters constrained
$wR(F^2) = 0.103$	$w = 1/[\sigma^2(F_o^2) + (0.049P)^2 + 0.1709P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{max} < 0.001$
1816 reflections	$\Delta\rho_{max} = 0.33$ e Å^{-3}
100 parameters	$\Delta\rho_{min} = -0.34$ e Å^{-3}
0 restraints	Absolute structure: Flack (1983), 662 Freidel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.02 (11)

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

4-Ethyl-1-(4-methoxybenzylidene)thiosemicarbazide

Yu-Feng Li[a] and Fang-Fang Jian[b]*

[a]Microscale Science Institute, Department of Chemistry and Chemical Engineering, Weifang University, Weifang 261061, People's Republic of China, and [b]Microscale Science Institute, Weifang University, Weifang 261061, People's Republic of China Correspondence e-mail: liyufeng8111@163.com

Received 9 June 2010; accepted 14 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.053; wR factor = 0.160; data-to-parameter ratio = 20.1.

In the title compound, $C_{11}H_{15}N_3OS$, the dihedral angle between the aromatic ring and the thiourea unit is 4.28 (7)° and an intramolecular N—H···N hydrogen bond generates an S(5) ring. In the crystal, molecules are linked into (001) sheets by N—H···S hydrogen bonds.

4-Ethyl-1-(4-methoxybenzylidene)thiosemicarbazide

Y.-F. Li and F.-F. Jian

Comment

Thiosemicarbazones have attracted much attention because they can be utilized as effective ligands to form the compounds with antitumoral drugs. (Quiroga & Ranninger, 2004).They are important versatile coordination agents which have been reported to be coordination compounds (Casas *et al.*, 2000) (Lobana *et al.*, 2009). As part of our search for new thiosemicarbazones compounds we synthesized the title compound (I), and describe its structure here. The dihedral angle between the benzene ring and the thiourea unit is [4.28 (7)°]. Intermolecular N—H···S hydrogen bonds generate chains.

Bond lengths and angles agree with those observed in a related compound (Li & Jian, 2010).

Experimental

A mixture of 4-methoxybenzaldehyde (0.1 mol) and 4-ethylthiosemicarbazide (0.1 mol) was stirred in refluxing ethanol (20 ml) for 2 h to afford the title compound (0.086 mol, yield 86%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H = 0.97 Å, and with U_{iso}(H) = 1.2–1.5U_{eq}(C).

Figures

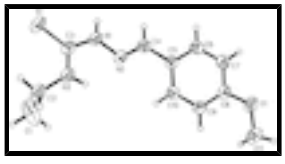

Fig. 1. The structure of (I) showing 30% probability displacement ellipsoids.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.053	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.160	H-atom parameters constrained
S = 1.05	$w = 1/[\sigma^2(F_o^2) + (0.0997P)^2 + 0.2868P]$ where $P = (F_o^2 + 2F_c^2)/3$
2912 reflections	$(\Delta/\sigma)_{max}$ = 0.001
145 parameters	$\Delta\rho_{max}$ = 0.26 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.34 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

2-Methylpropan-2-aminium 4-hydroxybenzoate

Shu-Lan Yu

Chemistry Engineering Department, Weifang Vocational College, Weifang 261000, People's Republic of China
Correspondence e-mail: crystal_wf@163.com

Received 10 June 2010; accepted 12 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.057; wR factor = 0.168; data-to-parameter ratio = 18.0.

In the crystal of the title molecular salt, $C_4H_{12}N^+\cdot C_7H_5O_3^-$, the cation is linked to three nearby anions by N—H···O hydrogen bonds. An O—H···O hydrogen bond between anions further consolidates the packing.

Related literature

2-Methylpropan-2-aminium 4-hydroxybenzoate

S.-L. Yu

Experimental

A mixture of 2-methylpropan-2-amine(0.02 mol) and 4-hydroxybenzoic acid (0.02 mol) was stirred in ethanol (30 ml) at 353 K for 3 h to afford the title compound (yield 50%). Colourless bars of (I) were obtained by recrystallization from acetone at room temperature.

Refinement

H atoms were positioned geometrically and allowed to ride on their parent atoms, with N—H and C—H distances of 0.86 and 0.93–0.96 Å, respectively, and with $U_{iso}(H) = 1.2U_{eq}$ of the parent atoms.

Figures

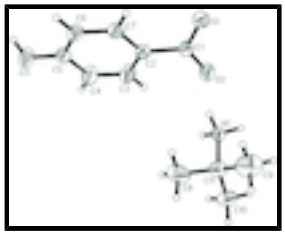

Fig. 1. The molecular structure of (I) with displacement ellipsoids drawn at the 30% probability level.

Data collection

Bruker SMART CCD diffractometer	1804 reflections with $I > 2\sigma(I)$

Radiation source: fine-focus sealed tube	$R_{int} = 0.039$
graphite	$\theta_{max} = 27.0°$, $\theta_{min} = 2.1°$
phi and ω scans	$h = 0 \rightarrow 8$
2899 measured reflections	$k = 0 \rightarrow 11$
2677 independent reflections	$l = -23 \rightarrow 23$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.057$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.168$	$w = 1/[\sigma^2(F_o^2) + (0.0928P)^2 + 0.1735P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{max} < 0.001$
2677 reflections	$\Delta\rho_{max} = 0.22$ e Å^{-3}
149 parameters	$\Delta\rho_{min} = -0.29$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.59 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4-Ethyl-1-[4-(methylsulfanyl)benzylidene]thiosemicarbazide

Yu-Feng Li[a] and Fang-Fang Jian[b]*

[a]Microscale Science Institute, Department of Chemistry and Chemical Engineering, Weifang University, Weifang 261061, People's Republic of China, and [b]Microscale Science Institute, Weifang University, Weifang 261061, People's Republic of China Correspondence e-mail: liyufeng8111@163.com

Received 10 June 2010; accepted 14 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.053; wR factor = 0.201; data-to-parameter ratio = 20.9.

There are four independent molecules in the asymmetric unit of the title compound, $C_{11}H_{15}N_3S_2$, with different conformations: the dihedral angles between the benzene rings and thiourea units are 16.85 (9), 0.56 (10), 8.05 (12) and 4.56 (8)°. Each molecule contains an intramolecular N—H···N hydrogen bond, generating an S(5) ring. The crystal structure is stabilized by intermolecular N—H···S hydrogen bonds.

4-Ethyl-1-[4-(methylsulfanyl)benzylidene]thiosemicarbazide

Y.-F. Li and F.-F. Jian

Comment

As part of our ongoing studies of thiosemicarbazone compounds (Li & Jian, 2010), we synthesized the title compound (I), and describe its structure here. In the four independent molecules, the dihedral angle between the benzene ring and the thiourea unit is [16.85 (9)°], [0.56 (10)°], [8.05 (12)°], [4.56 (8)°] respectively.

Experimental

A mixture of 4-ethylthiosemicarbazide (0.1 mol), and 4-(methylthio)benzaldehyde (0.1 mol) was stirred in refluxing ethanol (20 ml) for 2 h to afford the title compound (0.086 mol, yield 86%). Colourless blocks of (I) were obtained by recrystallization from ethanol at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.97 Å, and with U_{iso}=1.2–1.5U_{eq}.

Figures

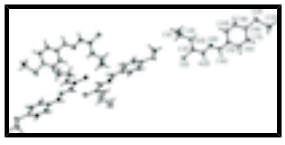

Fig. 1. The structure of (I) showing 30% probability displacement ellipsoids.

4-Ethyl-1-[4-(methylsulfanyl)benzylidene]thiosemicarbazide

Crystal data

$C_{11}H_{15}N_3S_2$	Z = 8
M_r = 253.38	F(000) = 1072
Triclinic, $P\overline{1}$	D_x = 1.272 Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, λ = 0.71073 Å
a = 10.496 (2) Å	Cell parameters from 8042 reflections
b = 15.737 (3) Å	θ = 3.0–27.5°
c = 17.542 (4) Å	μ = 0.38 mm^{-1}
α = 111.07 (3)°	T = 293 K
β = 91.62 (3)°	Block, colorless
γ = 100.43 (3)°	0.22 × 0.20 × 0.18 mm
V = 2645.4 (9) Å^3	

Data collection

Bruker SMART CCD diffractometer	8042 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.042$
graphite	$\theta_{max} = 27.5°$, $\theta_{min} = 3.0°$
phi and ω scans	$h = -13\rightarrow13$
26033 measured reflections	$k = -20\rightarrow20$
12032 independent reflections	$l = -22\rightarrow22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.053$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.201$	H-atom parameters constrained
$S = 1.31$	$w = 1/[\sigma^2(F_o^2) + (0.1P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
12032 reflections	$(\Delta/\sigma)_{max} = 0.001$
577 parameters	$\Delta\rho_{max} = 0.68$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.44$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 11 June 2010; accepted 12 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.005 Å; R factor = 0.045; wR factor = 0.163; data-to-parameter ratio = 10.2.

The structure of the title compound, $C_{13}H_{17}NO$, features an *anti* disposition of the N—H and carbonyl groups. The amide group is twisted with respect to the benzene ring [N–C(=O)–C–C torsion angle = −30.8 (4)°]. In the crystal, $C(4)$ chains propagating in [100] are formed by intermolecular N–H···O hydrogen bonds. Weak C—H···π interactions link the chains into sheets.

N-Cyclohexylbenzamide

I. U. Khan, R. Javaid, S. Sharif and E. R. T. Tiekink

Comment

Benzamides are frequently used in the synthesis of new and potent anti-convulsant agents (Clark *et al.*, 1988; Leander *et al.*, 1988; Diouf *et al.*, 1997). The structure of the title compound, (I), a benzamide derivative, is reported herein (Fig. 1).

The benzene ring, adjacent to the carbonyl group, twisted with respect to the plane formed through the central amide group; the N1–C1–C2–C3 torsion angle = -30.8 (4) °. In the same way, the putative mirror plane through the cyclohexyl ring (having a chair conformation) is twisted away from the central plane; the O1–N1–C8–C11 torsion angle is 151.3 (4) °. The anti-disposition of the NH and carbonyl groups allows for the formation of N–H···O hydrogen bonds which leads to the formation supramolecular chains aligned along the *a* axis, Fig. 2 and Table 1. These are connected into layers in the *ab* plane *via* C–H···π interactions, Fig. 2 and Table 1.

Experimental

A solution of cyclohexyl amine (0.458 µl, 4 mmol) in dichloromethane (15 ml) was treated dropwise with benzoyl chloride (0.463 µl, 4 mmol) in the presence of triethanol amine (5 ml) as a catalyst. The resulting mixture was stirred for 1 h. The precipitates that formed were filtered, dried and crystallized from methanol to yield colourless blocks of (I).

Refinement

The C-bound H atoms were geometrically placed (C–H = 0.93–0.98 Å) and refined as riding with U_{iso}(H) = 1.2U_{eq}(C). The N-bound H atom was refined freely. In the absence of significant anomalous scattering effects, 1130 Friedel pairs were averaged in the final refinement.

Figures

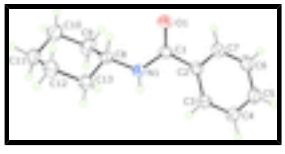

Fig. 1. The molecular structure of (I) showing displacement ellipsoids at the 35% probability level.

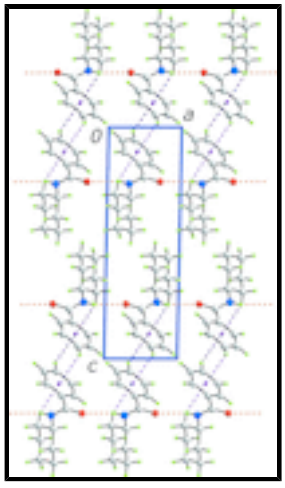

Fig. 2. A view in projection down the *b* axis of the unit-cell contents for (I), highlighting the formation of layers in the *ab* plane. The N–H···O and C–H···π interactions are shown as orange and purple dashed lines, respectively. Colour code: O, red; N, blue; C, grey; and H, green.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.045$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.163$	$w = 1/[\sigma^2(F_o^2) + (0.1083P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$

S = 1.07	$(\Delta/\sigma)_{max} < 0.001$
1423 reflections	$\Delta\rho_{max} = 0.22$ e Å^{-3}
140 parameters	$\Delta\rho_{min} = -0.21$ e Å^{-3}
1 restraint	Absolute structure: unk
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 11 June 2010; accepted 13 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.012 Å; R factor = 0.083; wR factor = 0.244; data-to-parameter ratio = 35.0.

In the title compound, $[Co(C_{12}H_8N_2)_3][ReO_4]_2\cdot H_2O$, the Co^{II} atom is coordinated by three 1,10-phenanthroline ligands in a distorted octahedral arrangement. In the crystal, the components are linked by O—H···O, C—H···O and aromatic π–π stacking [shortest centroid–centroid separation = 3.659 (5) Å] interactions.

Tris(1,10-phenanthroline)cobalt(II) bis(perrhenate) monohydrate

S. Toumi Akriche, Z. A. Al Othman, M. Rzaigui and R. M. Mahfouz

Comment

As part of our exploration of metal complexes with possible biological applications (Li *et al.*, 2010), we now report the structure of the title compound, (I)> It contains one cationic mononuclear species $[Co(phen)_3]^{2+}$, two perrhenate anions, and one lattice water molecule (Fig. 1). The unique crystallographically independent Co^{II} exhibits a distorted octahedral environment with a τ value of 0.05 (2) calaculated using the approach of Reedijk and co-workers (Addison *et al.*, 1984). Six nitrogen donors from three bidendate phen ligands are coordinated to Co^{II}. The Co^{II} is slightly displaced from the octahedron centroid by 0.053 (1) Å. The structural data are in good agreement with those of the cobalt(II) complexes which exhibit a similar geometry (Li *et al.*, 2010). The phen molecules are nearly planar (mean deviation is 0.048 (3) Å). The mean dihedral angle between the two pyridyl planes being 3.0 (2)°. The intra-ring C—N and C—C bond distances have respectively the usual mean values 1,344 (8) Å) and 1.397 (11)Å (Ikotun *et al.*, 2008). The angles subtended by the bidentate phen ligand at the cobalt atom are comparable with a mean value 77,9(2)°. The charges are counterbalanced by uncoordinated perrhenate anions which are connected through hydrogen bonds (C—H ···O) to the coordinated phen molecules (Table 1 and Fig. 2). The mononuclear units are also interconnected through intermolecular hydrogen bonds involving the uncoordinated water molecule and perrhenate oxygen atoms (Table 1) to form trinuclear unit which is further stabilized by the inter-phen ring *p*-p stacking (Fig. 2). The mean interplanar distance is 3.719 Å and the angle made by ring normal and the vector between the ring centroids is 7.95° (mean value).

Experimental

An aqueous solution (15 ml) of NH_4ReO_4 (0.54 g; 2 mmol) was slowly added under stirring to a mixture of ethanol (5 ml) and water (15 ml) containing phen (0,42 g; 3 mmol) and $CoCl_2$ (0.2 g; 1 mmol). The purple solution was left in air for a week and pink prisms of (I) were recovered.

Refinement

The water H atoms were located in a difference map and freely refined. All H atoms attached to C atoms were fixed geometrically and treated as riding, with C—H = 0.93 Å and with U_{iso}(H) = 1.2Ueq(C).

Figures

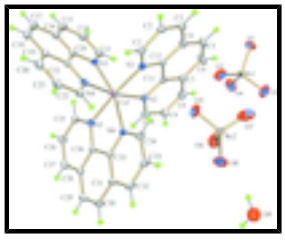

Fig. 1. The structure of (I) with displacement ellipsoids drawn at the 30% probability level.

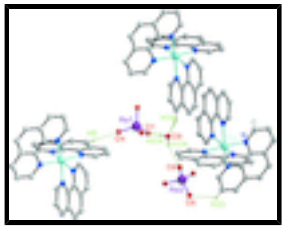

Fig. 2. Hydrogen-bonding interactions in (I); the H-atoms not involved in H-bonding are omitted.

$M_r = 1117.96$	$F(000) = 1066$
Triclinic, $P\overline{1}$	$D_x = 2.105$ Mg m^{-3}
Hall symbol: -P 1	Ag $K\alpha$ radiation, $\lambda = 0.56087$ Å
$a = 10.350$ (5) Å	Cell parameters from 25 reflections
$b = 13.133$ (3) Å	$\theta = 9$–$11°$
$c = 14.392$ (2) Å	$\mu = 3.97$ mm^{-1}
$\alpha = 73.58$ (2)°	$T = 293$ K
$\beta = 71.18$ (2)°	Prism, pink
$\gamma = 78.50$ (3)°	0.17 × 0.15 × 0.13 mm
$V = 1763.6$ (10) Å^3	

Data collection

Enraf–Nonius CAD-4 diffractometer	$R_{int} = 0.027$
Radiation source: fine-focus sealed tube	$\theta_{max} = 28.0°$, $\theta_{min} = 2.2°$
graphite	$h = -17 \rightarrow 17$
non–profiled ω scans	$k = -21 \rightarrow 21$
24086 measured reflections	$l = -6 \rightarrow 24$
17274 independent reflections	2 standard reflections every 120 min
8056 reflections with $I > 2\sigma(I)$	intensity decay: 3%

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.083$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.244$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.1366P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
17274 reflections	$(\Delta/\sigma)_{max} = 0.035$
493 parameters	$\Delta\rho_{max} = 5.34$ e Å^{-3}
3 restraints	$\Delta\rho_{min} = -5.31$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 11 June 2010; accepted 12 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.008 Å; R factor = 0.046; wR factor = 0.080; data-to-parameter ratio = 6.4.

In the title compound, $C_{16}H_9F_4N_3O_2$, the dihedral angle between the aromatic ring systems is 4.10 (14)° and a bifurcated intramolecular N—H···(O,F) hydrogen bond generates an S(6) ring for the O-atom acceptor and an S(5) ring for the F-atom acceptor. A short C—H···O conact also occurs. In the crystal, molecules are linked by C—H···O interactions.

1-Acetyl-3-[2-(2,3,5,6-tetrafluorophenyl)hydrazin-1-ylidene]indolin-2-one

H. Pervez, M. Yaqub, M. Ahmad, M. N. Tahir and R. Akhtar

Comment

In continuation of our previous work on the synthesis of isatin derivatives having physiological properties (Pervez *et al.*, 2007, 2008, 2010*a*, 2010*b*), we report herein the synthesis and crystal structure of the title compound (I), (Fig. 1).

The crystal structure of *N*-(2-chloropyrid-4-yl)-*N*'-(2,3,5,6-tetrafluorophenyl)urea (Abad *et al.*, 2006) has been published which contains the same flouro substituted phenyl group as in (I).

In (I), the 2-oxoindolin-3-hydrazono group A (N3/C1–C8/O2/N1/N2) and tetrafluorophenyl B (C11—C16/F1–F4) are planar with r. m. s. deviations of 0.0197 and 0.0121 Å, respectively. The dihedral angle between A/B is 4.10 (14)°. The acetyl moiety (O1/C9/C10) is oriented at 6.21 (83)° with its parent group A. One S(5) ring motif (Bernstein *et al.*, 1995) is formed due to intramolecular H-bonding of N—H···F type, two S(6) ring motifs due to N—H···O and C—H···O interactions (Table 1, Fig. 1) are formed. The molecules are stabilized in the form of one dimensional polymeric chains extending along the *a* axis (Fig. 2).

Experimental

A solution of 1-acetylisatin (0.95 g, 5.0 mmol) in ethanol (50 ml) was added to the solution of 2,3,5,6-tetrafluorophenyl hydrazine (0.90 g, 5.0 mmol) made in concentrated sulfuric acid (8 ml) and diluted with ethanol (50 ml). The reaction mixture was then refluxed for 30 min. The bright yellow crystalline solid formed during refluxing was collected by suction filtration. Thorough washing with hot ethanol furnished the desired compound (I) in pure form (0.40 g, 23%), m.p. 445 K. Bright yellow prisms of (I) were grown in chloroform by slow evaporation method at room temperature.

Refinement

In the absence of anamolous scattering, the Friedal pairs were merged before refinement. The H-atoms were positioned geometrically (N–H = 0.86 Å, C–H = 0.93–0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C, N), where x = 1.5 for methyl and x = 1.2 for all other H-atoms.

Figures

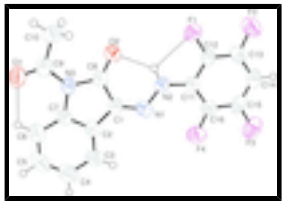

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level. The dotted lines indicate the intra-molecular H-bondings.

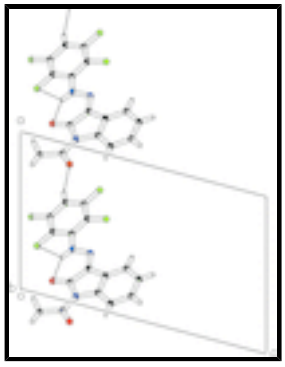

Fig. 2. The partial packing of (I), which shows that molecules form one-dimensional polymeric chains extending along the *a* axis.

1-Acetyl-3-[2-(2,3,5,6-tetrafluorophenyl)hydrazin-1-ylidene]indolin-2-one

Crystal data

$C_{16}H_9F_4N_3O_2$	$F(000) = 356$
$M_r = 351.26$	$D_x = 1.589$ Mg m^{-3}
Monoclinic, $P2_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2yb	Cell parameters from 749 reflections
$a = 9.8993$ (19) Å	$\theta = 2.6$–$25.3°$
$b = 4.7740$ (6) Å	$\mu = 0.14$ mm^{-1}
$c = 16.066$ (3) Å	$T = 296$ K
$\beta = 104.807$ (8)°	Prism, yellow
$V = 734.0$ (2) Å^3	0.32 × 0.24 × 0.22 mm
$Z = 2$	

Data collection

Bruker Kappa APEXII CCD diffractometer	1462 independent reflections
Radiation source: fine-focus sealed tube	749 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.087$
Detector resolution: 8.10 pixels mm^{-1}	$\theta_{max} = 25.3°$, $\theta_{min} = 2.1°$
ω scans	$h = -11 \rightarrow 11$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -5 \rightarrow 5$
$T_{min} = 0.942$, $T_{max} = 0.952$	$l = -19 \rightarrow 19$
6095 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.080$	H-atom parameters constrained

$S = 0.96$	$w = 1/[\sigma^2(F_o^2) + (0.0218P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
1462 reflections	$(\Delta/\sigma)_{max} < 0.001$
227 parameters	$\Delta\rho_{max} = 0.14$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.18$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 12 June 2010; accepted 12 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.041; wR factor = 0.100; data-to-parameter ratio = 19.8.

In the title compound, $C_{17}H_{18}BrN_3O_2S$, the dihedral angle between the aromatic rings is 9.15 (17)°. A bifurcated intramolecular N—H···(N,O) hydrogen bond generates two S(5) rings and a weak intramolecular C—H···S interaction completes an S(6) ring motif. In the crystal, inversion dimers linked by pairs of N—H···S hydrogen bonds generate $R_2^2(8)$ loops and weak C—H···S and C—H···π interactions are also present.

1-[1-(4-Bromophenyl)ethylidene]-4-(2,4-dimethoxyphenyl)thiosemicarbazide

M. Yaqub, H. Pervez, N. Arif, M. N. Tahir and M. Hussain

Comment

Thiosemicarbazones have wide pharmacological properties (Beraldo & Gambino, 2004). Prompted by this, we recently reported the synthesis and medicinal importance of some isatins-thiosemicarbazones (Pervez *et al.*, 2008, 2010*a*,*b*). Now, we report the synthesis and crystal structure of the title compound (I), (Fig. I).

The crystal structure of (II) *i.e.* 4-fluoroacetophenone-*N*-propylthiosemicarbazone (Martinez *et al.*, 2006) and (III) *i.e.* 4-phenyl-1-(1-phenylethylidene)thiosemicarbazide (Jian, *et al.*, 2005) have been published. The title compound (I) is different from (II) and (III) due to attachment of substituants at the phenyl rings.

In (I), the phenyl ring A (C1–C6) of 2,4-dimethoxyanilino group, B (C11—C16) of 4-bromophenyl are planar with r. m. s. deviations of 0.0034 and 0.0036 Å, respectively. The thiosemicarbazone moiety C (N1—N3/C9/S1) is also planar with r. m. s. deviation of 0.0062 Å from its mean square plane. The dihedral angle between A/B, A/C and B/C is 9.15 (17), 2.07 (17) and 9.12 (16)°, respectively. Two S(5) ring motifs (Bernstein *et al.*, 1995) (Table 1, Fig. 1) are formed due to strong intramolecular H-bonding of N—H···N and N—H···O types. The weak interaction of C—H···S type completes an S(6) ring motif. The molecules are dimerized due to intermolecular interactions of N—H···S type and complete $R_2^2(8)$ ring motif (Fig. 2). The dimers are interlinked through C—H···S interactions (Table 1). The C—H···π interaction (Table 1) also play role in stabilizing the molecules.

Experimental

A solution of 4-(2,4-dimethoxyphenyl)thiosemicarbazide (0.15 g, 0.66 mole) in warm ethanol (20 ml) was added drop wise to the stirred solution of 4-bromoacetophenone (0.13 g, 0.66 mol) in warm ethanol (10 ml) containing 2–3 drops of acetic acid. The resultant mixture was then heated under reflux for 30 min. After cooling the reaction mixture to room temperature, the yellow solid was collected by suction filtration, washing with ethanol furnished the title compound in pure form (0.21 g, 95%), m.p. 502 K. Colourless prisms of (I) were grown in chloroform-petroleum ether (1:5) system at room temperature by diffusion method.

Refinement

The H-atoms were positioned geometrically (N–H = 0.86 Å, C–H = 0.93–0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C, N), where x = 1.5 for methyl and x = 1.2 for all other H-atoms.

Figures

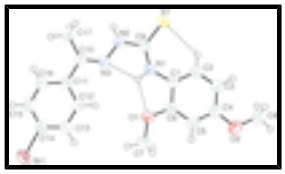

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level. The dotted lines indicate the intra-molecular H-bonds.

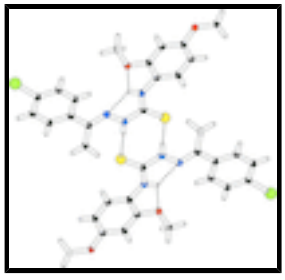

Fig. 2. The partial packing of (I), which shows that molecules form dimers.

1-[1-(4-Bromophenyl)ethylidene]-4-(2,4-dimethoxyphenyl)thiosemicarbazide

Crystal data

$C_{17}H_{18}BrN_3O_2S$	$F(000) = 832$
$M_r = 408.31$	$D_x = 1.546$ Mg m^{-3}
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2yn	Cell parameters from 2654 reflections
$a = 5.8390$ (2) Å	$\theta = 2.2$–$28.3°$
$b = 30.3335$ (11) Å	$\mu = 2.48$ mm^{-1}
$c = 9.9423$ (4) Å	$T = 296$ K
$\beta = 94.910$ (2)°	Prism, colorless
$V = 1754.49$ (11) Å^3	0.25 × 0.22 × 0.20 mm
$Z = 4$	

Data collection

Bruker Kappa APEXII CCD diffractometer	4346 independent reflections
Radiation source: fine-focus sealed tube	2654 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.044$
Detector resolution: 7.5 pixels mm^{-1}	$\theta_{max} = 28.3°$, $\theta_{min} = 2.2°$
ω scans	$h = -4 \rightarrow 7$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$k = -40 \rightarrow 40$
$T_{min} = 0.642$, $T_{max} = 0.652$	$l = -13 \rightarrow 13$
17115 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.041$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.100$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0413P)^2 + 0.4088P]$ where $P = (F_o^2 + 2F_c^2)/3$
4346 reflections	$(\Delta/\sigma)_{max} = 0.001$
220 parameters	$\Delta\rho_{max} = 0.42$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.36$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 15 June 2010; accepted 19 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.047; wR factor = 0.113; data-to-parameter ratio = 19.0.

The asymmetric unit of the title compound, $C_{13}H_{13}NO_3S$, contains two crystallographically independent molecules in which the dihedral angles between the phenyl and benzene rings are 88.16 (12) and 44.50 (12)°. One of the molecules features an intramolecular N—H···O hydrogen bond. In the crystal, the molecules are linked into dimers by pairs of N—H···O hydrogen bonds. The dimers are further connected by C—H···O and C—H···π interactions, forming a three-dimensional network.

N-(2-Methoxyphenyl)benzenesulfonamide

Aziz-ur-Rehman, M. A. Sajjad, M. Akkurt, S. Sharif, M. A. Abbasi and I. U. Khan

Comment

Sulfonamides are well known for their enormous potential as biologically active molecules (Rough *et al.*, 1998) in areas such as anti-microbial (Kayser *et al.*, 2004), anti-convulsant (Arshad *et al.*, 2008), anti-cancer agents and for the treatment of inflammatory rheumatic and non-rheumatic processes including onsets and traumatologic lesions (Gennarti *et al.*, 1994). In the present paper, the structure of *N*-(2-methoxyphenyl)benzene sulfonamide has been determined as part of a research program involving the synthesis and biological evaluation of sulfur containing compounds.

In the crystal structure of the title compound (I), (Fig. 1), there exist two independent molecules, A (with S1) and B (with S1'). Both independent molecules are bent at their *S* atoms with the C—S—N(H)—C torsion angles of 67.25 (15)° in molecule A and -81.17 (16)° in molecule B. The dihedral angles between the phenyl and benzene rings is 88.16 (12)° in molecule A and 44.50 (12)° in molecule B.

Molecular packing of (I) is stabilized by N–H···O, C—H···O interactions and C—H···π interactions, forming a three dimensional network (Table 1). Fig. 2 shows N—H···O hydrogen bonds between the molecules A and B in the asymmetric unit.

Experimental

A mixture benzenesulfonyl chloride (10.0 mmol; 1.45 ml), *ortho*-methoxy aniline (*o*-anisidine) (10.0 mmol; 1.12 ml), aqueous sodium carbonate (10%; 15.0 ml) and water (25 ml) was stirred for one hour at room temperature. The crude mixture was washed with water and dried. The product was dissolved in methanol and recrystallized by slow evaporation of the solvent, to generate colourless blocks of (I) in 74% yield.

Refinement

The H atoms of the NH groups were located in a difference Fourier map and refined with the N—H distance restrained to 0.86 (2) %A. The other H atoms were positioned geometrically using a riding model with C–H = 0.93 and 0.96 Å. All H atoms were refined with isotropic displacement parameters with U_{iso}(H) = 1.2U_{eq}(aromatic, NH) and U_{iso}(H) = 1.5U_{eq}(methyl).

Figures

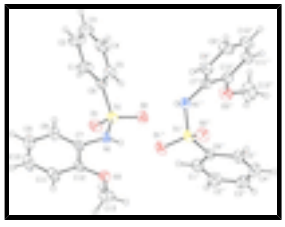

Fig. 1. View of the two independent molecules in the asymmetric unit of (I0 with displacement ellipsoids drawn at the 30% probability level.

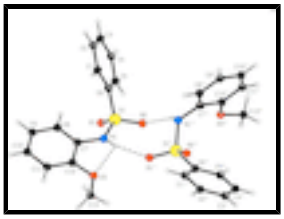

Fig. 2. View of N—H···O hydrogen bonds shown as dashed lines between the two independent molecules in the asymmetric unit.

Crystal data

$C_{13}H_{13}NO_3S$	$F(000) = 1104$
$M_r = 263.31$	$D_x = 1.373$ Mg m^{-3}
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2yn	Cell parameters from 5117 reflections
$a = 8.7705$ (2) Å	$\theta = 2.5$–$23.9°$
$b = 28.1684$ (7) Å	$\mu = 0.25$ mm^{-1}
$c = 10.7256$ (3) Å	$T = 296$ K
$\beta = 105.968$ (1)°	Block, colourless
$V = 2547.53$ (11) Å^3	0.25 × 0.17 × 0.07 mm
$Z = 8$	

Data collection

Bruker APEXII CCD diffractometer	4145 reflections with $I > 2\sigma(I)$
Radiation source: sealed tube	$R_{int} = 0.043$
graphite	$\theta_{max} = 28.3°$, $\theta_{min} = 3.3°$
φ and ω scans	$h = -11 \rightarrow 11$
24823 measured reflections	$k = -37 \rightarrow 37$
6318 independent reflections	$l = -14 \rightarrow 14$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.113$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0488P)^2 + 0.3381P]$ where $P = (F_o^2 + 2F_c^2)/3$
6318 reflections	$(\Delta/\sigma)_{max} = 0.001$
333 parameters	$\Delta\rho_{max} = 0.29$ e Å^{-3}
2 restraints	$\Delta\rho_{min} = -0.29$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Received 16 June 2010; accepted 20 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.008 Å; R factor = 0.084; wR factor = 0.189; data-to-parameter ratio = 16.7.

In the title compound, $C_{15}H_{16}N_2O_6S_2$, the dihedral angle between the benzene rings is 83.2 (3)°. The molecular conformation is stabilized by an intramolecular C—H···O interaction. In the crystal structure, molecules are linked by N—H···O and C—H···O hydrogen bonds and additional stabilization is provided by weak C—H···π interactions.

N-{[4-(4-Methoxybenzenesulfonamido)phenyl]sulfonyl}acetamide

G. Mustafa, M. Akkurt, I. U. Khan, R. Naseem and B. Sajjad

Comment

Sulphacetamide sodium is an antibiotic which is being used for eye infections. Because the antiobiotics lose their efficacy after long term used, so there is a need to derivatize them to get better therapeutic result. In this paper, a new derivative of it is being reported. Previously this drug has also been derivatized by other researchers (Ashfaq *et al.*, 2009, 2010). Here we present the crystal structure of the title compound (I), (Fig. 1).

In (I), the benzene rings (C1–C6) and (C8–C13) are twisted with a dihedral angle of 83.2 (3) ° to each other. Molecular conformation is stabilized by intramolecular C–H···O interactions. Intermolecular N—H···O and C—H···O hydrogen bonds and C—H···π interactions contribute to the stabilization of the crystal structure (Table 1, Fig. 2).

Experimental

Sodium sulphacetamide (0.5 g, 2.32 mmol) was taken in 50 ml round bottom flask and dissolved in 20 ml of distilled water. Then, methoxy benzene sulfonyl chloride (0.46 g, 2.32 mmol) was added with continuous stirring at ambient temperature. The pH of this solution was strictly maintained between 8 and 9 by using $NaHCO_3$ (3 *M*). The consumption of suspended methoxy benzene sulfonyl chloride was an indication of reaction completion. Then pH was adjusted to 2–3 using HCl (3 N). The precipitates formed were filtered, washed three to four times with distilled water and recrystallised using methanol to yield colourless rods of (I).

Refinement

All H-atoms were positioned geometrically and refined using a riding model with d(N—H) = 0.86 Å, $U_{iso} = 1.2U_{eq}$(N) for NH, 0.93 Å, $U_{iso} = 1.2U_{eq}$(C) for aromatic and 0.96 Å, $U_{iso} = 1.5U_{eq}$(C) for CH_3 hydrogen atoms.

Figures

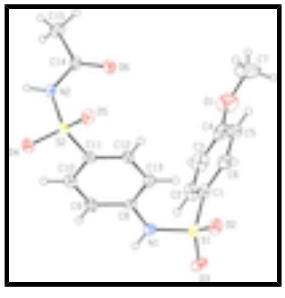

Fig. 1. The title molecule with displacement ellipsoids for non-H atoms drawn at the 30% probability level.

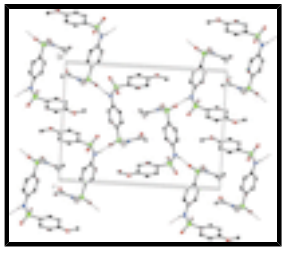

Fig. 2. The packing and hydrogen bonding of (I) viewed down *a* axis. H atoms not participating in hydrogen bonding have been omitted for clarity.

N-{[4-(4-Methoxybenzenesulfonamido)phenyl]sulfonyl}acetamide

Crystal data

$C_{15}H_{16}N_2O_6S_2$	$F(000) = 800$
$M_r = 384.44$	$D_x = 1.544$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 1463 reflections
$a = 5.3651$ (10) Å	$\theta = 2.9$–$20.1°$
$b = 20.551$ (3) Å	$\mu = 0.36$ mm^{-1}
$c = 15.034$ (2) Å	$T = 296$ K
$\beta = 94.040$ (7)°	Rod, colourless
$V = 1653.5$ (4) Å^3	0.25 × 0.08 × 0.07 mm
$Z = 4$	

Data collection

Bruker Kappa APEXII CCD diffractometer	1608 reflections with $I > 2\sigma(I)$
Radiation source: sealed tube	$R_{int} = 0.114$
graphite	$\theta_{max} = 28.4°$, $\theta_{min} = 3.3°$
phi and ω scans	$h = -7 \rightarrow 7$
13678 measured reflections	$k = -27 \rightarrow 26$
3771 independent reflections	$l = -20 \rightarrow 20$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.084$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.189$	H-atom parameters constrained
$S = 0.89$	$w = 1/[\sigma^2(F_o^2) + (0.068P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3771 reflections	$(\Delta/\sigma)_{max} < 0.001$
226 parameters	$\Delta\rho_{max} = 0.83$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.32$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

2-Amino-4-methylpyridinium 3-chlorobenzoate

Madhukar Hemamalini and Hoong-Kun Fun*‡

X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia
Correspondence e-mail: hkfun@usm.my

Received 18 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.029; wR factor = 0.117; data-to-parameter ratio = 25.7.

In the title salt, $C_6H_9N_2^+\cdot C_7H_4ClO_2^-$, the 2-amino-4-methylpyridinium cation is almost planar, with a maximum deviation of 0.010 (1) Å. In the crystal, the protonated N atom and the 2-amino group of the cation are hydrogen bonded to the carboxylate O atoms of the anion *via* a pair of N—H···O hydrogen bonds, forming an $R_2^2(8)$ ring motif. The ion pairs are further connected *via* N—H···O and C—H···O hydrogen bonds, forming a two-dimensional network parallel to the *bc* plane.

2-Amino-4-methylpyridinium 3-chlorobenzoate

M. Hemamalini and H.-K. Fun

Comment

Recently, much attention has been devoted to the design and synthesis of supramolecular architectures assembled via various weak noncovalent interactions, such as hydrogen bonds, π···π stacking and C—H···π interactions (Remenar *et al.*, 2003; Aakeröy *et al.*, 2001; Sokolov *et al.*, 2006). 2-Aminopyridine and its derivatives are used in the manufacture of pharmaceuticals, hair dyes and other dyes. They are often involved in hydrogen-bond interactions (Jeffrey & Saenger, 1991; Jeffrey, 1997; Scheiner, 1997). The crystal structures of 2-amino-4-methyl pyridine (Kvick & Noordik, 1977) and 2-amino-4-methylpyridinium 4-aminobenzoate (Shen *et al.*, 2008) have been reported. We have recently reported the crystal structures of 2-amino-4-methylpyridinium 4-nitrobenzoate (Hemamalini & Fun, 2010*a*) and 2-Amino-4-methylpyridinium trifluoroacetate (Hemamalini & Fun, 2010*b*) from our laboratory. In continuation of our studies of pyridinium derivatives, the crystal structure determination of the title salt has been undertaken.

The asymmetric unit of the title compound, (Fig 1), contains a protonated 2-amino-4-methylpyridinium cation and a 3-chlorobenzoate anion. The 2-amino-4-methylpyridinium cation is planar, with a maximum deviation of 0.010 (1) Å for atom C1. The protonated N1 atom has lead to a slight increase in the C1—N1—C5 angle to 121.66 (11)°, compared to the corresponding angle of 117.3 (1)° in neutral 2-amino-4-methylpyridine (Kvick & Noordik, 1977). The bond lengths (Allen *et al.*, 1987) and angles are normal.

In the crystal packing, (Fig. 2), the protonated N atom and 2-amino group (N2) is hydrogen-bonded to the carboxylate oxygen atoms (O1 and O2) via a pair of N—H···O hydrogen bonds leading to the formation of a $R^2_2(8)$ ring (Bernstein *et al.*, 1995). Furthermore, these motifs are connected via N2—H2C···O2 and C5—H5A···O1 hydrogen bonds to form two-dimensional networks parallel to the *bc*-plane.

Experimental

A hot methanol solution (20 ml) of 2-amino-4-methylpyridine (54 mg, Aldrich) and 3-chlorobenzoic acid (78 mg, Merck) were mixed and warmed over a heating magnetic-stirrer hotplate for a few minutes. The resulting solution was allowed to cool slowly at room temperature and colourless needles of (I) appeared after a few days.

Refinement

All hydrogen atoms were positioned geometrically [C–H = 0.93 or 0.96 Å] and were refined using a riding model, with U_{iso}(H) = 1.2 or 1.5 U_{eq}(C). A rotating group model was used for the methyl group. 1860 Friedel pairs were used to determine the absolute configuration.

Figures

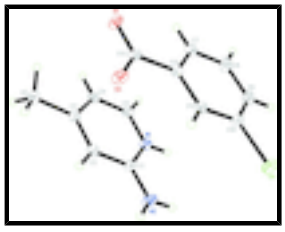

Fig. 1. The asymmetric unit of (I). Displacement ellipsoids are drawn at the 50% probability level.

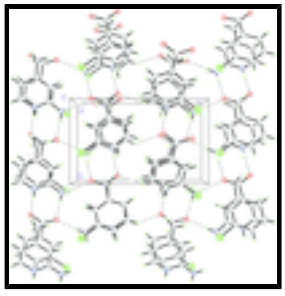

Fig. 2. The crystal packing of (I), showing hydrogen-bonded (dashed lines) 2D networks parallel to the *bc*-plane.

2-Amino-4-methylpyridinium 3-chlorobenzoate

Crystal data

$C_6H_9N_2^+ \cdot C_7H_4ClO_2^-$	$F(000) = 276$
$M_r = 264.70$	$D_x = 1.432$ Mg m^{-3}
Monoclinic, $P2_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2yb	Cell parameters from 6601 reflections
$a = 7.9930$ (6) Å	$\theta = 3.9$–$35.1°$
$b = 6.8608$ (5) Å	$\mu = 0.31$ mm^{-1}
$c = 11.2148$ (9) Å	$T = 100$ K
$\beta = 93.526$ (2)°	Needle, colourless
$V = 613.84$ (8) Å^3	0.28 × 0.17 × 0.10 mm
$Z = 2$	

Data collection

Bruker APEXII DUO CCD diffractometer	4207 independent reflections
Radiation source: fine-focus sealed tube	4076 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.019$
φ and ω scans	$\theta_{max} = 32.5°$, $\theta_{min} = 3.9°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -12 \rightarrow 12$
$T_{min} = 0.919$, $T_{max} = 0.971$	$k = -10 \rightarrow 10$
9325 measured reflections	$l = -16 \rightarrow 16$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.029$	H-atom parameters constrained
$wR(F^2) = 0.117$	$w = 1/[\sigma^2(F_o^2) + (0.0801P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.22$	$(\Delta/\sigma)_{max} < 0.001$
4207 reflections	$\Delta\rho_{max} = 0.64$ e Å^{-3}
164 parameters	$\Delta\rho_{min} = -0.54$ e Å^{-3}
1 restraint	Absolute structure: Flack (1983), 1860 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: −0.01 (4)

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 18 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.001 Å; R factor = 0.045; wR factor = 0.136; data-to-parameter ratio = 27.3.

The asymmetric unit of the title quinoxaline compound, $C_{10}H_9N_3O_2$, contains two crystallographically independent molecules (*A* and *B*). The quinoxaline ring systems are essentially planar, with maximum deviations of 0.006 (1) and 0.017 (1) Å, respectively, for molecules *A* and *B*. In molecule *A*, the dihedral angle formed between the quinoxaline ring system and nitro group is 10.94 (3)° [6.31 (13)° for molecule *B*]. In the crystal, molecules are linked into chains propagating along [001]: one forms zigzag chains linked by C—H···O hydrogen bonds, whilst the other forms ladder-like chains by way of C—H···N and C—H···O hydrogen bonds. The packing is further consolidated by weak π–π interactions [range of centroid–centroid distances = 3.5895 (7)–3.6324 (7) Å].

2,3-Dimethyl-6-nitroquinoxaline

R. M. Ghalib, R. Hashim, S. H. Mehdi, J. H. Goh and H.-K. Fun

Comment

The direct condensation of various benzene-1,2-diamines with 1,2-dicarboxyl compounds has been successfully achieved in excellent yields using (NH_4Cl-CH_3OH) catalyst system at room temperature (Darabi *et al.*, 2008). Here in this study our method comprises the synthesis of the title compound by the reaction of 4-nitro-o-phenylenediamine and butanedione in distilled water. The procedure can be performed for a broad scope of quinoxaline derivatives and is eco-friendly.

The asymmetric unit of the title quinoxaline compound comprises of two crystallographically independent 2,3-dimethyl-6-nitroquinoxaline molecules, designated molecules *A* and *B* (Fig. 1). The two independent molecules having closely similar geometries, as shown in the superposition of the non-H atoms of molecules *A* and *B* (Fig. 2) using *XP* in *SHELXTL* (Sheldrick, 2008), giving an r.m.s. deviation of 0.116 Å.

In each molecule, the quinoxaline ring system (C1-C8/N1/N2) is essentially planar, with maximum deviations of -0.006 (1) and -0.017 (1) Å, respectively, for atoms C1A of molecule *A* and C3B of molecule *B*. There are slight inclinations between the quinoxaline ring systems and nitro groups, as indicated by the dihedral angles formed of 10.94 (3) and 6.31 (13)°, respectively, for molecules *A* and *B*. The bond lengths and angles are comparable to those observed in the reported quinoxaline structures (Ghalib *et al.*, 2010; Wozniak *et al.*, 1993).

The interesting feature of the crystal packing (Fig. 3) is that no intermolecular hydrogen bond is observed between the two independent molecules and they are packed in different manners. Adjacent molecules *A* are linked by intermolecular C3A—H3A···N2A and C10A—H10A···O2A hydrogen bonds (Table 1) into ladder-like chains incorporating $R^2_2(13)$ ring motifs (Bernstein *et al.*, 1995) whereas intermolecular C9B—H9D···O1B hydrogen bonds (Table 1) link adjacent molecules *B* into zig-zag shaped chains. Both chains are running along the [001] direction. Further consolidation of the crystal packing is provided by weak *Cg*1···*Cg*2 and *Cg*1···*Cg*3 interactions [*Cg*1···*Cg*2 = 3.5895 (7) Å, symmetry code: x, y, z; *Cg*1···*Cg*2 = 3.6324 (7) Å, symmetry code: x-1, y, z; *Cg*1···*Cg*3 = 3.6228 (7) Å, symmetry code: x, y, z; *Cg*1 and *Cg*2 are the centroids of the C2A–C7A and C2B–C7B benzene rings, respectively; *Cg*3 is the centroid of the C1B/N1B/C2B/C7B/N2B/C8B pyrazine ring].

Experimental

The title compound was synthesized as reported in the literatures (Darabi *et al.*, 2009; Ajaikumar & Pandurangan, 2009). A mixture of 4-nitro-o-phenylenediamine (1.5310 g) and butanedione (0.8775 g) in molar ratio 1:1 were refluxed in distilled water for 1 h. The reaction mixture was dried on rota vapor at low pressure and then recrystallized with a 1:1 mixture of alcohol-chloroform to afford brownish crystals of the title compound (1.76 g, *M.p.* 406 K).

Refinement

All H atoms were placed in their calculated positions, with C—H = 0.93 or 0.96 Å, and refined using a riding model, with U_{iso} = 1.2 or 1.5 U_{eq}(C). The rotating group model is applied to the methyl groups.

Figures

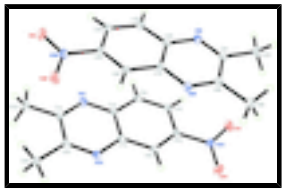

Fig. 1. The molecular structure of (I) showing 30 % probability displacement ellipsoids for non-H atoms.

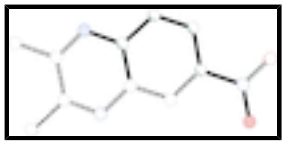

Fig. 2. Fit of molecule *A* (dashed lines) on molecule *B* (solid lines). H atoms have been omitted for clarity.

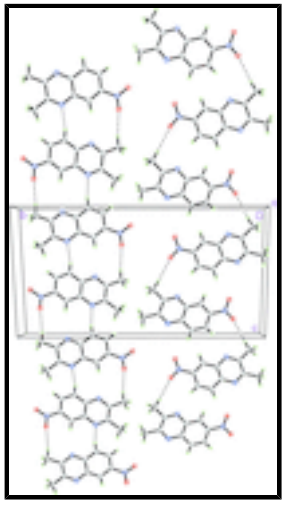

Fig. 3. The crystal structure of (I), viewed along the *a* axis, showing the molecules being linked into one-dimensional chains along the [001] direction. Intermolecular hydrogen bonds are shown as dashed lines.

52279 measured reflections	$l = -20 \rightarrow 20$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.136$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.077P)^2 + 0.2747P]$ where $P = (F_o^2 + 2F_c^2)/3$
7510 reflections	$(\Delta/\sigma)_{max} = 0.001$
275 parameters	$\Delta\rho_{max} = 0.55$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.20$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 18 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.004 Å; R factor = 0.059; wR factor = 0.163; data-to-parameter ratio = 13.9.

The molecule of the title compound, $C_{13}H_{11}NO$, is almost planar (r.m.s. deviation = 0.013 Å), apart from the cyanide group, for which the C and N atoms deviate from the mean plane of the other atoms by 0.341 (3) and 0.571 (4) Å, respectively. In the crystal, weak aromatic π–π stacking [centroid–centroid distance = 3.758 (3) Å] may help to stabilize the structure.

2-(7-Methoxy-1-naphthyl)acetonitrile

W. Wei, R. Jia, J. Sun and H.-B. Wang

Comment

Naphthylethyl acetonitrile is an important pharmaceutical intermediate for synthesizing *N*-naphthylethyl amide derivatives which was evaluated as melatonin receptor ligands (Depreux & Lesieur, 1994). We report herein the crystal structure of the title compound, (I).

In the molecule of the title compound (Fig 1), the bond lengths and angles are within normal ranges. Rings A (C3—C7/C12), B (C8—C12)are, of course, planar, and they are oriented at dihedral angle A/B= 1.10 (3) °. So, they are nearly co-planar. No classical hydrogen bond was found in the molecule. The π–π contacts between the naphthalene rings, *Cg*1—*Cg*2^{i} [symmetry codes: -*x*,1 - *y*,1 - *z*, where *Cg*1 and *Cg*2 are centroids of the rings A (C3—C7/C10/C12), and B (C8—C12), respectively] may further stabilize the structure, with centroid-centroid distances of 3.758 (3) Å.

Experimental

(7-Methoxy-1-naphthyl)acetic acid was reacted with thionyl chloride in $CHCl_3$, and the crude acid chloride was treated with aqueous ammonia to produce (7-Methoxy-1-naphthyl)acetamide. Dehydration of this amide with trifluoroacetic anhydride in THF at 273 K gave the title compound (Yous & Andrieux, 1992). Crystals suitable for X-ray analysis were obtained by slow evaporation of a methanol solution (yield; 66%, m.p. 353 K).

Refinement

H atoms were positioned geometrically, with C—H = 0.93 Å for aromatic H and C—H = 0.96 and 0.97 Å for methyl and methylene H, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = xU_{eq}(C,*O*), where *x* = 1.5 for OH H and *x* = 1.2 for all other H atoms.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.059$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.163$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.069P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
1897 reflections	$(\Delta/\sigma)_{max} < 0.001$
136 parameters	$\Delta\rho_{max} = 0.14$ e Å^{-3}

0 restraints $\Delta\rho_{min} = -0.14$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

In the title compound, $C_{15}H_{13}NO_4\cdot H_2O$, the Schiff base exists in a zwitterionic form and a bifurcated intramolecular N—H···(O,O) hydrogen bond generates two S(6) rings. The dihedral angle between the two benzene rings is 25.8 (2)°. The crystal structure is stabilized by intermolecular O—H···O hydrogen bonds.

2-[(2-Hydroxy-4-methoxybenzylidene)azaniumyl]benzoate monohydrate

Z.-X. Hang, B. Dong and X.-W. Wang

Comment

The crystal structures of Schiff bases have been widely reported (Alpaslan *et al.*, 2010*a*,*b*; Aritake *et al.*, 2010; Bahron *et al.*, 2010). As a continuation of our work on Schiff bases (Hang, 2010), the present paper reports the title Schiff base compound.

The title compound contains a Schiff base molecule and a water molecule of crystallization (Fig. 1). There exist two intramolecular N–H···O hydrogen bonds in the molecule of the compound. The dihedral angle between the two benzene rings is 25.8 (2)°. The crystal structure is stabilized by intermolecular O–H···O hydrogen bonds (Table 1, Fig. 2).

Experimental

Equimolar quantities (1 mmol each) of 2-aminobenzoic acid and 4-methoxysalicylaldehyde were mixed and stirred in methanol for 2 h at ambient temperature. The resulting mixture was concentrated under recuced pressure. The residue, purified by washing with cold methanol and diethyl ether, afforded the pure product of the hydrazone compound. Colorless blocks of (I) were obtained by recrystallization of the product from 95% ethanol.

Refinement

The H atoms attached to N and O atoms were found from a difference Fourier map and refined isotropically, with N–H, O–H, and H···H distances restrained to 0.90 (1), 0.85 (1), and 1.37 (2) Å, respectively. The remaining H atoms were positioned geometrically and refined using a riding model with C–H = 0.93 and 0.96 Å, and U_{iso}(H) = 1.2 or 1.5U_{eq}(C).

Figures

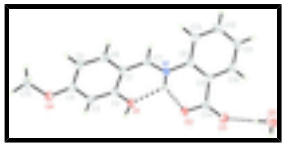

Fig. 1. Ellipsoid plot of the title compound at the 30% probability level. Hydrogen atoms are drawn as spheres of arbitrary radius. O–H···N hydrogen bond is drawn by a dashed line.

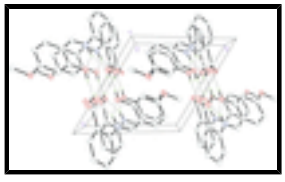

Fig. 2. The molecular packing of the title compound, viewed along the *c* axis. Hydrogen bonds are drawn as dashed lines.

2-[(2-Hydroxy-4-methoxybenzylidene)azaniumyl]benzoate monohydrate

Crystal data

$C_{15}H_{13}NO_4·H_2O$ $Z = 2$

M_r = 289.28	F(000) = 304
Triclinic, $P\overline{1}$	D_x = 1.436 Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, λ = 0.71073 Å
a = 8.7240 (5) Å	Cell parameters from 1109 reflections
b = 8.9252 (4) Å	θ = 2.6–26.2°
c = 10.7967 (5) Å	μ = 0.11 mm^{-1}
α = 111.312 (2)°	T = 298 K
β = 93.084 (3)°	Block, colorless
γ = 117.500 (2)°	0.30 × 0.28 × 0.28 mm
V = 669.24 (6) Å^3	

Data collection

Bruker SMART CCD diffractometer	2810 independent reflections
Radiation source: fine-focus sealed tube	1992 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.013
ω scans	θ_{max} = 27.0°, θ_{min} = 2.1°
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	h = −6→11
T_{min} = 0.968, T_{max} = 0.970	k = −11→11
4045 measured reflections	l = −13→13

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.043	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.122	H atoms treated by a mixture of independent and constrained refinement
S = 1.08	$w = 1/[\sigma^2(F_o^2) + (0.0595P)^2 + 0.0161P]$ where $P = (F_o^2 + 2F_c^2)/3$
2810 reflections	$(\Delta/\sigma)_{max} < 0.001$
203 parameters	$\Delta\rho_{max}$ = 0.15 e Å^{-3}
5 restraints	$\Delta\rho_{min}$ = −0.18 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-

factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.004 Å; R factor = 0.046; wR factor = 0.138; data-to-parameter ratio = 15.8.

In the title molecular salt, $C_{12}H_{16}N_3O_2^+\cdot ClO_4^-$, the nitro group is close to being coplanar with the benzene ring [dihedral angle = 8.1 (3)°]. The seven-membered ring has a maximum deviation of 0.502 (3) Å at the C atom between the dimethyl- and methyl-substituted C atoms. In the crystal, the components are linked into infinite sheets lying parallel to the *bc* plane by N—H···O and C—H···O hydrogen bonds. A short O···N contact of 2.896 (4) Å occurs within the sheets and a short O···O contact of 2.608 (4) Å occurs between the sheets.

2,2,4-Trimethyl-7-nitro-2,3-dihydro-1*H*-1,5-benzodiazepin-5-ium perchlorate

S. H. Mehdi, O. Sulaiman, R. M. Ghalib, C. S. Yeap and H.-K. Fun

Comment

Benzodiazepines are interesting compounds due to their wide range of biological activities (Landquist, 1984). Recently many methods have been employed for the synthesis of benzodiazepines derivatives (Insuasty *et al.*, 2010; Balakrishna & Kaboudin, 2001; Ballo *et al.*, 2010). Here we report the synthesis and the crystal structure of title compound.

The asymmetric unit of title compound (Fig. 1) consists of one the benzodiazepinium cation and one perchlorate anion. The nitro group is coplanar with the benzene ring with the dihedral angle of 8.1 (3)°. The seven-membered ring (N1/C1/C6/N2/C7–C9) have a maximum deviation of 0.502 (3) Å at atom C8. In the crystal structure, the molecules are linked into infinite two-dimensional planes parallel to *bc* plane by the intermolecular N—H···O, C—H···O hydrogen bonds (Table 1) and short O6···N3 interaction of 2.896 (4) Å. Short O2···O3 interaction of 2.608 (4) Å linked these planes into a three-dimensional framewrok (Fig. 2).

Experimental

A mixture of 4-nitro *o*-phenylenediamine (0.153 g m) and 4-hydroxy coumarin (0.162 g m) in molar ratio 1:1 was refluxed in a mixture of acetic acid-ethanol (1:1 *v*/*v*) for 3 h (Grech *et al.*, 1994). The solid settled in the reaction mixture was filtered and crystallized from ethanol to furnish brownish plates of the unexpected title compound, (I) (55%, m.p. 458 K).

Refinement

The N-bound hydrogen atoms were located from the difference Fourier map and were refined freely. The rest of hydrogen atoms were positioned geometrically [C–H = 0.93–0.97 Å] and refined using a riding model, with U_{iso}(H) = 1.2 or 1.5U_{eq}(C). Rotating-group model was applied for methyl groups.

Figures

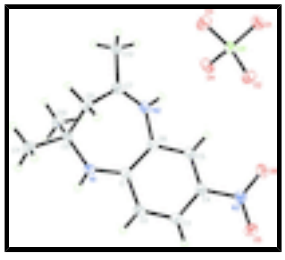

Fig. 1. The molecular structure of (I) with 50% probability ellipsoids for non-H atoms.

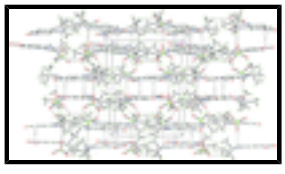

Fig. 2. The crystal packing of (I), viewed down the *c* axis, showing the components linked into a 3-D network. Intermolecular hydrogen bonds are shown as dashed lines.

2,2,4-Trimethyl-7-nitro-2,3-dihydro-1*H*-1,5-benzodiazepin-5-ium perchlorate

Crystal data

$C_{12}H_{16}N_3O_2^+ \cdot ClO_4^-$	$F(000) = 1392$
$M_r = 333.73$	$D_x = 1.538$ Mg m^{-3}
Monoclinic, *C*2/*c*	Mo *K*α radiation, λ = 0.71073 Å
Hall symbol: -C 2yc	Cell parameters from 7331 reflections
a = 21.046 (7) Å	θ = 2.2–29.8°
b = 11.818 (3) Å	μ = 0.30 mm^{-1}
c = 15.636 (6) Å	*T* = 100 K
β = 132.176 (9)°	Plate, brown
V = 2882.0 (16) Å^3	0.30 × 0.17 × 0.08 mm
Z = 8	

Data collection

Bruker APEXII DUO CCD diffractometer	3323 independent reflections
Radiation source: fine-focus sealed tube	2816 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.066$
φ and ω scans	$\theta_{max} = 27.5°$, $\theta_{min} = 2.2°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -27 \rightarrow 27$
$T_{min} = 0.915$, $T_{max} = 0.976$	$k = -15 \rightarrow 15$
24582 measured reflections	$l = -20 \rightarrow 20$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.138$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0714P)^2 + 7.0069P]$ where $P = (F_o^2 + 2F_c^2)/3$
3323 reflections	$(\Delta/\sigma)_{max} < 0.001$
210 parameters	$\Delta\rho_{max} = 0.69$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.69$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.002 Å; R factor = 0.046; wR factor = 0.117; data-to-parameter ratio = 15.9.

In the title compound, $C_{14}H_{18}N_2O$, the benzimidazole grouping is close to planar, with a maximum deviation of 0.042 Å; the six-membered non-aromatic ring adopts an envelope conformation. In the crystal structure, molecules are linked into infinite sheets lying parallel to the *bc* plane by O—H···N and C—H···O hydrogen bonds.

Comment

Benzimidazole derivatives are an important class of bioactive molecules and are well known due to their wide range of pharmacological activities as an anti-ulcers, anti-hypertensive, anti-viral, anti-fungal, anti-cancer, and anti-histaminic (Horton *et al.*, 2003; Insuasty *et al.*, 2008*a*, *b*) agents. Here we report the synthesis and the crystal structure of title compound.

In the title compound (Fig. 1), the benzimidazole group is essentially coplanar (N1/C1–C6/N2/C11) with the maximum deviation of 0.042 Å at atom C6. The N2/C7–C11 ring adopts an envelope conformation with Q=0.4933 (14) Å, θ=52.81 (15)° and φ=182.3 (2)° (Cremer & Pople, 1975).

In the crystal structure, the molecules are linked into infinite two-dimensional planes parallel to *bc* plane by the intermolecular O1—H1O1···N1 and C5—H5A···O1 hydrogen bonds (Fig. 2, Table 1).

Experimental

A mixture of *o*-phenylenediamine (0.108 g m) and dimedone (0.140 g m) in molar ratio 1:1 was refluxed in a mixture of acetic acid-ethanol (1:1 *v*/*v*) for 3 h (Grech *et al.*, 1994). The reaction mixture was dried on rotavapor at low pressure and further fractionated successively with diethyl ether, chloroform and ethanol. The ethanol fraction was dried on rotavapor and the dry mass so obtained was crystallized in methanol:chloroform (1:1) mixture to give yellow needles of (I) (55%, m.p. 451 K).

Refinement

All hydrogen atoms were located from the difference Fourier map and was refined freely.

Figures

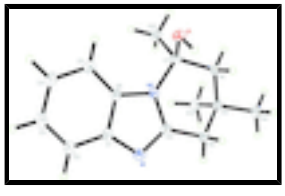

Fig. 1. The molecular structure of (I) with 50% probability ellipsoids for non-H atoms.

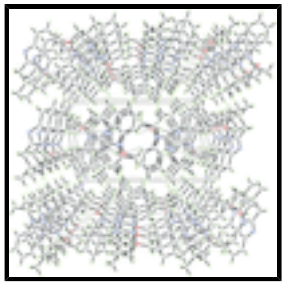

Fig. 2. The crystal packing of (I), viewed down the *b* axis, showing the molecules linked into sheets lying parallel to *bc*. Intermolecular hydrogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.117$	All H-atom parameters refined
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0528P)^2 + 0.2357P]$ where $P = (F_o^2 + 2F_c^2)/3$
3597 reflections	$(\Delta/\sigma)_{max} < 0.001$

226 parameters	$\Delta\rho_{max} = 0.33$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.25$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 19 June 2010; accepted 19 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.004 Å; R factor = 0.065; wR factor = 0.188; data-to-parameter ratio = 15.5.

In the title compound, $C_{25}H_{18}ClNO$, the conformation about the C=C double bond is *E*. Significant twists are evident in the molecule, with the benzene ring forming a dihedral angle of 53.92 (11)° with the quinolinyl residue. Further, the chalcone residue is approximately perpendicular to the quinolinyl residue [$C_q-C_q-C_c-O_c$ torsion angle = −104.5 (3)°, where q = quinolinyl and c = chalcone]. In the crystal, the presence of C—H···O and C—H···π interactions leads to supramolecular layers lying parallel to ($\bar{1}$02).

Comment

Both quinolines (Campbell *et al.*, 1998) and open chain flavonoids, *i.e.* chalcones (Chen *et al.*, 2001; Zi & Simoneau, 2005), are known to possess a wide range of biological activities. Herein, in continuation of previous studies (Prasath *et al.*, 2010), we describe the crystal structure of a molecule containing both quinoline and chalcone residues, namely, the title compound, (I).

In (I), Fig. 1, the quinolinyl residue is planar [r.m.s. = 0.041 Å] with both the benzene ring and chalcone residue being twisted out of the plane. The dihedral angle formed between the quinolinyl and benzene (C20–C25) rings is 53.92 (11) °. In the case of the chalcone residue, the twist is best illustrated by the O1–C9–C10–C11 torsion angle of -104.5 (3) °. There are also twists within the chalcone residues as exemplified by the C7–C8–C9–O1 and C7–C8–C9–C10 torsion angles of -163.7 (3) and 14.7 (4) °, respectively. The conformation about the C7═C8 bond [1.340 (4) Å] is E.

Supramolecular layers parallel to ($\bar{1}$ 0 2) are evident in the crystal structure. These, Fig. 2 and Table 1, are stabilized by C–H···O contacts and C–H···π interactions where the π-system is the NC_5 ring of the quinolinyl residue.

Experimental

A mixture of 3-acetyl-6-chloro-2-methyl-4-phenylquinoline (0.01 *M*), benzaldehyde (0.0 1*M*) and a catalytic amount of KOH in distilled ethanol (50 ml) was stirred for about 12 h. The resulting mixture was concentrated to remove ethanol, poured on to ice and neutralized with dilute acetic acid. The solid that formed was filtered, dried, purified by column chromatography using a 1:1 mixture of ethyl acetate and petroleum ether, and recrystallized using ethyl acetate to produce colourless blocks of (I); Yield: 65% and m.pt: 400 K.

Refinement

The C-bound H atoms were geometrically placed (C–H = 0.95–0.98 Å) and refined as riding with U_{iso}(H) = 1.2–1.5U_{eq}(C).

Figures

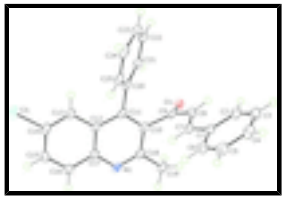

Fig. 1. The molecular structure of (I) showing displacement ellipsoids at the 50% probability level.

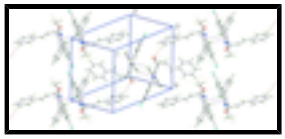

Fig. 2. A view of the supramolecular array in (I) highlighting the C–H···O and C–H···π interactions as orange and purple dashed lines, respectively.

16152 measured reflections	$l = -21 \rightarrow 21$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.065$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.188$	H-atom parameters constrained
$S = 1.09$	$w = 1/[\sigma^2(F_o^2) + (0.0925P)^2 + 1.6015P]$ where $P = (F_o^2 + 2F_c^2)/3$
3948 reflections	$(\Delta/\sigma)_{max} < 0.001$
254 parameters	$\Delta\rho_{max} = 0.85$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.49$ e Å^{-3}

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 20 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 290 K; mean σ(C–C) = 0.004 Å; R factor = 0.043; wR factor = 0.121; data-to-parameter ratio = 15.1.

The piperidone ring in the title compound, $C_{18}H_{17}Cl_2NOS_2$, has a distorted half-chair conformation. The S-bound benzene rings are approximately perpendicular to and splayed out of the mean plane through the piperidone ring [dihedral angles = 71.86 (13) and 46.94 (11)°]. In the crystal, C—H···O interactions link the molecules into [010] supramolecular chains with a helical topology. C—H···Cl and C—H···π interactions are also present.

3,3-Bis[(4-chlorophenyl)sulfanyl]-1-methylpiperidin-2-one

J. Zukerman-Schpector, C. A. De Simone, P. R. Olivato, C. R. Cerqueira Jr, J. M. M. Santos and E. R. T. Tiekink

Comment

As part of our on-going research on the conformational and electronic interactions in β-thio-carbonyl compounds, *e.g.* *N*,*N*-diethyl-2-[(4'-substituted) phenylthio]acetamides, *N*-methoxy-*N*-methyl-2-[(4'-substituted) phenylthio]propanamides, and 1-methyl-3-phenylsulfonyl-2-piperidone, utilizing spectroscopic, theoretical and X-ray diffraction methods (Vinhato, 2007; Olivato *et al.*, 2009; Zukerman-Schpector *et al.* 2008), the title compound, (I), was synthesized and its crystal structure determined.

In (I), Fig. 1, the piperidone ring has a distorted half-chair conformation: the ring-puckering parameters are q_2 = 0.453 (2) Å, q_3 = -0.271 (2) Å, QT = 0.528 (3) Å, φ_2 = 37.4 (3) ° (Cremer & Pople, 1975). While the S2-bound benzene ring is orientated to be almost perpendicular to the plane through the piperidone ring [dihedral angle = 71.86 (13) °], the S1-bond benzene ring is somewhat splayed with respect to the other rings, forming dihedral angles of 46.94 (11) and 61.68 (13) ° with those through the piperidone and S2-bound benzene rings, respectively.

Supramolecular helical chains aligned along the *b* axis dominate the crystal packing, Fig. 2 and Table 1, and these are sustained in the crystal structure by C–H···Cl and C–H···π interactions, Table 1.

Experimental

Firstly, 4-chlorothiophenol (5.8 g, 40 mmol) was reacted with bromine (1.1 ml, 40 mmol) in dichloromethane (250 ml) on hydrated silica gel support (25 g of SiO_2 and 12 ml of water) to give 4-chlorophenyl disulfide (5.3 g, yield = 93%). A yellow solid was obtained after filtration and evaporation without further purification (Hashmat & McDermott, 2002). 1-Methyl-2-piperidinone (2.0 g, 18 mmol) was added dropwise to a cooled (195 K) solution of hexamethylphosphoramide (HMPA) (3.3 ml, 18 mmol), diisopropylamine (2.6 ml, 18 mmol) and butyllithium (11.5 ml, 18 mmol) in THF (60 ml). After 20 minutes, 4-chlorophenyl disulfide (5.3 g, 18 mmol) dissolved in THF (10 ml) was added dropwise to the enolate solution (Zoretic & Soja, 1976). After stirring for 3 h at 195 K, water (80 ml) was added at room temperature and extraction with chloroform was performed. The organic layer was dried over anhydrous sodium sulfate. After evaporation of solvent, a crude solid was obtained. Purification through flash chromatography with a solution of hexane and ethyl acetate in a 7:3 ratio give the pure product (2.8 g, yield = 35%). Irregular lumps of (I) were obtained by vapour diffusion of *n*-hexane into a chloroform solution held at 283 K; m.p. 372–373 K. IR (cm^{-1}): ν(C=O) 1663. NMR ($CDCl_3$, p.p.m.): δ 1.93–1.95 (2*H*, m), 1.97–1.99 (2*H*, m), 2.91 (3*H*, s), 3.21 (2*H*, triplet, J = 6.0 Hz), 7.31–7.33 (4*H*, m, Aryl-H), 7.55–7.57 (4*H*, m, Aryl-H). Analysis found: C 54.33, H 4.30, N 3.39%. $C_{18}H_{17}OCl_2NS_2$ requires: C 54.27, H 4.30, N 3.52%.

Refinement

The H atoms were geometrically placed (C–H = 0.93–0.97 Å) and refined as riding with U_{iso}(H) = 1.2–1.5U_{eq}(C).

Figures

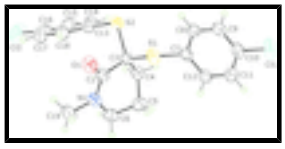

Fig. 1. The molecular structure of (I) showing displacement ellipsoids at the 35% probability level (arbitrary spheres for the H atoms).

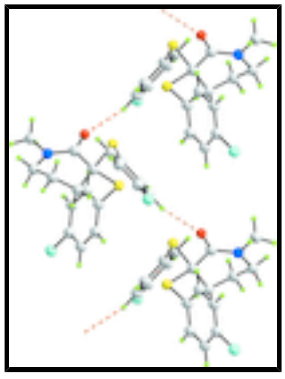

Fig. 2. Supramolecular chain in (I) mediated by C–H···O interactions (orange dashed lines). The chain with helical topology is aligned along the *b* axis.

3,3-Bis[(4-chlorophenyl)sulfanyl]-1-methylpiperidin-2-one

Crystal data

$C_{18}H_{17}Cl_2NOS_2$	$F(000) = 824$
$M_r = 398.37$	$D_x = 1.397$ Mg m^{-3}
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2yn	Cell parameters from 10679 reflections
$a = 8.0313$ (2) Å	$\theta = 2.9$–$27.5°$
$b = 9.7460$ (2) Å	$\mu = 0.57$ mm^{-1}
$c = 24.2623$ (7) Å	$T = 290$ K
$\beta = 94.0767$ (12)°	Irregular, colourless
$V = 1894.28$ (8) Å^3	0.33 × 0.30 × 0.29 mm
$Z = 4$	

Data collection

Nonius KappaCCD diffractometer	3288 independent reflections
Radiation source: sealed tube	2778 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.049$
CCD rotation images scans	$\theta_{max} = 25.0°$, $\theta_{min} = 3.3°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -9 \rightarrow 8$
$T_{min} = 0.82$, $T_{max} = 0.85$	$k = -11 \rightarrow 11$
12888 measured reflections	$l = -28 \rightarrow 26$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.121$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0558P)^2 + 0.758P]$ where $P = (F_o^2 + 2F_c^2)/3$
3288 reflections	$(\Delta/\sigma)_{max} < 0.001$
218 parameters	$\Delta\rho_{max} = 0.37$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.38$ e Å^{-3}

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 23 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.007 Å; R factor = 0.064; wR factor = 0.254; data-to-parameter ratio = 27.6.

In the title compound, $C_{20}H_{18}Br_2N_4O_8$, the interplanar angle of the pyrimidine rings is 75.1 (2)°. The central benzene ring is inclined at interplanar angles of 66.5 (2) and 71.9 (2)° with respect to the two pyrimidine rings. In the crystal structure, adjacent molecules are connected into two-molecule-thick arrays parallel to the *bc* plane *via* short Br···Br [3.5328 (12) Å] and Br···O [3.206 (3) and 3.301 (4) Å] interactions. A weak intermolecular π–π aromatic stacking interaction [centroid–centroid distance = 3.526 (3) Å] is also observed.

Methyl 2,6-bis[(5-bromo-4,6-dimethoxypyrimidin-2-yl)oxy]benzoate

H.-K. Fun, J. H. Goh, S. Rai, A. M. Isloor and P. Shetty

Comment

Methyl-2,6-bis[(5-bromo-4,6-dimethoxypyrimidin-2-yl)oxy]benzoate is a derivative of herbicide showing excellent herbicidal effects on annual and perennial weeds and high-safety crops, especially rice and wheat and is applied to paddy fields, ploughed fields and non-agricultural land (Koichiro *et al.*, 1988). Most sulphonylurea herbicides and all pyrimidinylbenzoate herbicides (He *et al.*, 2007) such as nicofulfuron, amidosulfuron, halopyrazosulfuron, ethoxysulfuron, pyriminobac-methyl and pyriftalid, possess 4,6-dimethoxypyrimidin-2-yl groups (Li *et al.*, 2006), while sulfometuron-methyl, a kind of sulfonylurea, contains 4,6-dimethylpyrimidin-2-yl groups, which suggests that the two disubstituted pyrimidin-2-yl groups possess high biological activity (Gerorge, 1983).

In the title compound (Fig. 1), the two pyrimidine rings with atom sequences N1/C1/C2/C3/N2/C4 and C11/N3/C12/C13/C14/N4 are essentially planar, with maximum deviations of -0.028 (6) and 0.010 (5) Å, respectively, at atoms C1 and N4. An interplanar angle of 75.1 (2)° is formed between these two pyrimidine rings. The central phenyl ring (C5-C10) is inclined at interplanar angles of 66.5 (2) and 71.9 (2)°, respectively, with respect to the N1/C1/C2/C3/N2/C4 and C11/N3/C12/C13/C14/N4 pyrimidine rings. The geometric parameters agree well with those observed in closely related structures (Fun *et al.*, 2010; Li & Luo, 2006).

In the crystal structure, no classical hydrogen bond is observed. The interesting features of the crystal structure are the intermolecular short Br···Br [Br1···Br2^{i} = 3.5328 (12) Å; (i) -x+1/2, y-1/2, -z+1/2] and Br···O [Br1···O8^{i} = 3.301 (4) and Br2···O1^{ii} = 3.206 (3) Å; (ii) x, -y+2, z+1/2] interactions, which are shorter than the sum of the Van der Waals radii of the relevant atoms, interconnecting adjacent molecules into two-molecule-thick arrays parallel to the *bc* plane. Weak intermolecular π–π aromatic stacking interactions [*Cg*1···*Cg*1^{iii} = 3.526 (3) Å; (iii): -x, y, -z+1/2] involving the C11/N3/C12/C13/C14/N4 pyrimidine ring further stabilize the crystal structure.

Experimental

To a stirred solution of methyl-2,6-dihydroxybenzoate (0.50 g, 0.0026 mol) in acetonitrile (10 ml) was added potassium carbonate (1.00 g, 0.0070 mol) and 5-bromo-4,6-dimethoxy-2-(methylsulfonyl)pyrimidine (1.78 g, 0.0050 mol). The reaction mixture was heated to reflux for 4 h. Mass analysis showed completion of the reaction. The reaction mixture was filtered and filtrate was concentrated. The residue was recrystallized using dichloromethane to obtain brown blocks of (I) (Yield: 67 %, *M.p.* 440–443 K).

Refinement

All H atoms were placed in their calculated positions, with C—H = 0.93 – 0.96 Å, and refined using a riding model with U_{iso} = 1.2 or 1.5 U_{eq}(C). The rotating group model was used for the methyl groups.

Figures

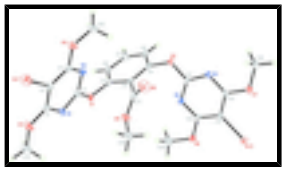

Fig. 1. The molecular structure of (I), showing 20 % probability displacement ellipsoids for non-H atoms.

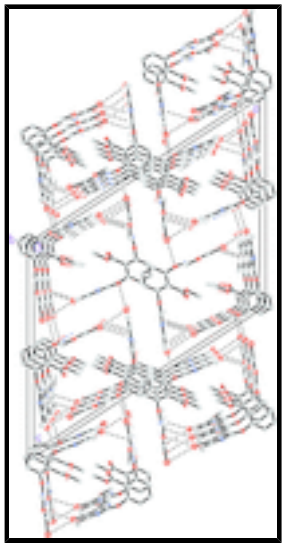

Fig. 2. The crystal structure of (I), viewed along the *b* axis, showing two-molecule-wide arrays parallel to the *bc* plane. H atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.064	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.254	H-atom parameters constrained
S = 1.02	$w = 1/[\sigma^2(F_o^2) + (0.1449P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
8438 reflections	$(\Delta/\sigma)_{max}$ = 0.001
306 parameters	$\Delta\rho_{max}$ = 1.32 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −1.56 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 26 June 2010; accepted 27 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.004 Å; R factor = 0.047; wR factor = 0.135; data-to-parameter ratio = 12.6.

In the title compound, $C_{14}H_{12}ClN_3O_2\cdot H_2O$, the benzene ring and the pyridine rings are oriented at a dihedral angle of 57.73 (12)° and an intramolecular O—H···N hydrogen bond generates an S(6) ring. In the crystal, the water molecule forms O—H···O and O—H···N hydrogen bonds to the organic molecule, leading to chains containing $R_4^4(16)$ loops. In addition, weak aromatic π–π stacking interactions between the centroids of pyridine rings [at distance of 3.864 (2) and 4.013 (2) Å] and C—H···π interactions occur.

Comment

We have reported crystal structures of Schiff bases containing pyridne (Shafiq *et al.*, 2009*a*, 2009*b*) and as a part of this project, we report herein the structure and synthesis of the title compound (I, Fig. 1).

In (I) the group A (C1–C8/O1/CL1) of 5-chloro-2-hydroxyacetophenone, the central group B (N1/N2/C9/O2) and the pyridine ring C (C10—C14/N3) are planar with r. m. s. deviation of 0.0330, 0.0182 and 0.0082 Å, respectively. The dihedral angle between A/B, A/C and B/C is 6.62 (11), 58.08 (10) and 52.98 (14)°, respectively. There exist intramolecular H-bonding of O—H···N type forming an S(6) ring motif (Bernstein *et al.*, 1995). The water molecule acts as donar as well as accepter and therefore interconnects three molecules. Due to intra as well as intermolecular H-bondings of O—H···O and O—H···N types (Table 1, Fig. 2), the title compound is stabilized in infinite one dimensional polymeric chains. In the polymeric chains $R_4^4(16)$ ring motifs are formed. The π–π interactions exist between the centroids of pyridine rings at distance of 3.864 (2) Å [symmetry: -*x*, -*y*, 1 - *z*] and at 4.013 (2) Å [symmetry: 1 - *x*, 1 - *y*, 1 - *z*]. The C—H···π interaction (Table 1) also plays an important role in stabilizing the structure.

Experimental

To a hot stirred solution of 5-chloro-2-hydroxyacetophenone (1.71 g, 0.01 mole) in ethanol, 25 ml nicotinic acid hydrazide (1.37 g, 0.01 mol) was added. The resultant mixture was then heated under reflux for 7–8 h. The reaction was monitored through TLC. The precipitate were formed were collected by suction filteration. The resultant crude material was dried and recrystalized in 1,4-dioxan:ethanol(1:2) to affoard light brown needles of (I).

Refinement

The coordinates of H-atoms of water molecule were refined. The H-atoms were positioned geometrically (O–H = 0.82, N–H = 0.86, C–H = 0.93–0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C, N, O), where x = 1.5 for methyl and x = 1.2 for all other H-atoms.

Figures

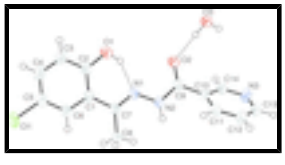

Fig. 1. View of the title compound with displacement ellipsoids drawn at the 50% probability level. The dotted line shows the intramolecular H-bond.

Fig. 2. The partial packing of (I), which shows that molecules form infinite one dimensional polymeric chains with different ring motifs.

N'-[(*E*)-1-(5-Chloro-2-hydroxyphenyl)ethylidene]pyridine-3- carbohydrazide monohydrate

Crystal data

10105 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.135$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.17$	$w = 1/[\sigma^2(F_o^2) + (0.0375P)^2 + 0.8617P]$ where $P = (F_o^2 + 2F_c^2)/3$
2491 reflections	$(\Delta/\sigma)_{max} < 0.001$

198 parameters

0 restraints

$\Delta\rho_{max} = 0.24$ e Å^{-3}

$\Delta\rho_{min} = -0.35$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 21 July 2010; accepted 3 August 2010

The name of one of the authors in the paper by Hussain *et al.* [*Acta Cryst.* (2010), E**66**, o1881] is corrected.

In the paper by Hussain *et al.* (2010), the last author is incorrectly given as 'Muhammad Mazhar'. The correct name of the last author should be 'Mazhar Hussain' as above.

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.002 Å; R factor = 0.045; wR factor = 0.127; data-to-parameter ratio = 18.1.

In the title compound, $C_{12}H_{12}N_4O$, the pyridine and pyrrole rings are inclined at an angle of 29.22 (8)° and an intramolecular C—H···N interaction geneates an S(6) ring. In the crystal, molecules are linked by N—H···N hydrogen bonds, forming (010) C(7) chains. The chains are cross-linked by weak C—H···O interactions, which generate $R_2^2(18)$ ring motifs within an infinite sheet. Finally, two C—H···π interactions are present, where the C—H groups are from the pyridine ring and π is the pyrrole ring.

Comment

We have reported crystal structures of Schiff bases with N-containing aromatic ring (Shafiq *et al.*, 2009*a*, 2009*b*), (Hussain *et al.*, 2010) and as a part of this project, we report herein the structure and synthesis of the title compound (I, Fig. 1).

In (I) the pyridine ring A (C1–C5/N1), the central moiety B (O1/C6/N2/N3/C7) and the pyrrol moiety C (C8—C11/N4/C12) are planar with r. m. s. deviations of 0.0345, 0.0285 and 0.0276 Å, respectively. The dihedral angle between A/B, A/C and B/C is 38.32 (8)°, 29.22 (8)° and 9.44 (13)°, respectively. In title molecule, there exist intra as well inter-molecular H-bondings (Table 1). The molecules form infinite one dimensional polymeric chains extending along the *b* axis (Fig. 2), if only strong H-bondings are considered. If the strong as well as weak H-bondings are considered then the molecules form two-dimensional polymeric chains with $R_2^2(18)$ (Bernstein *et al.*, 1995) ring motifs (Fig. 3). The C—H···π interactions (Table 1) also play important role in stabilizing the molecules.

Experimental

To a hot stirred solution of isoniazid (1.37 g, 0.01 mole) in ethanol 15 ml was added *N*-methylpyrrol-2-carboxaldehyde (1.1 ml, 0.01 mol). The resultant mixture was then heated under reflux. The reaction was monitored through TLC. After an hour, the precipitate were formed. The reaction mixture was further heated for 30 min. The resultant crude material was recrystalized in 1,4-dioxane:ethanol (1:4) to affoard red prisms of (I).

Refinement

The H-atoms were positioned geometrically (N–H = 0.86 Å, `C–H = 0.93–0.96 Å) and refined as riding with U_{iso}(H) = xU_{eq}(C, N), where x = 1.5 for methyl and x = 1.2 for all other H-atoms.

Figures

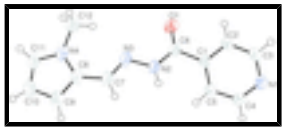

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radius.

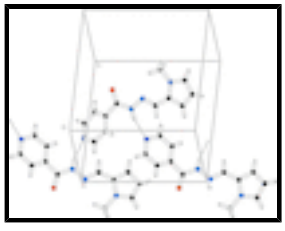

Fig. 2. The partial packing of (I), which shows that molecules form infinite one dimensional polymeric chains extending along *b* axis.

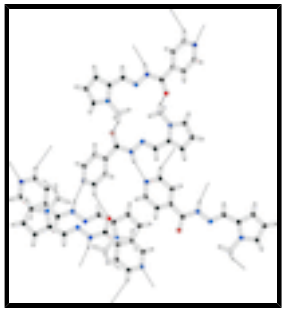

Fig. 3. The partial packing (*PLATON*; Spek, 2009) which shows that molecules form $R_2^2(18)$ ring motifs in the infinite polymeric chains.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.127$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0618P)^2 + 0.235P]$ where $P = (F_o^2 + 2F_c^2)/3$

2803 reflections	$(\Delta/\sigma)_{max} < 0.001$
155 parameters	$\Delta\rho_{max} = 0.28$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.21$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4,4'-[(2,7-Dibromofluorene-9,9-diyl)dimethylene]dipyridinium bis(perchlorate)

Z. Xuan, S. Zhao, L. Lu, X. Wang and X. Yang

Comment

A variety of ligands of different molecular dimensions and functional properties were utilized for the preparation of numerous supramolecular assemblies of exotic architectures as reported in the recent literature (Applegarth *et al.*, 2005). Herein, we report a new bipyridine derivative of 2,7-dibromo-9,9-(4-pyridyl-methyl) fluorene [DBPMF].

scheme I

The structure of the title compound contains a protonated 2,7-dibromo-9,9-bis(4-pyridinium-methyl) fluorene dications $DBPMFH_2^{2+}$ and two perchlorate anions ClO_4^-. All the bond lengths and bond angles in the phenyl ring and five-membered ring are corresponding with those observed in 2-acetylaminofluorene (Meerssche *et al.*, 1980) and 4-acetylamino-fluorene (Meerssche *et al.*, 1979). Two bromine atoms along with the thirteen atoms of fluorenyl ring are coplanar (P1) and the biggest deviation is 0.038Å for C6 atom. The dihedral angle between the plane P1 and the pyridyl ring containing N1 atom is 72.11 (2)°.

In the crystal lattice, there are four types of supramolecular interactions (Table 1), including N—H···O hydrogen bonds, C—H···O potential hydrogen bonds, C—H···π supramolecular interaction and π–π stacking interactions. Among these supramolecular interactions, the two types N—H···O hydrogen bonds link two $DBPMFH_2^{2+}$ cations with two ClO_4^- anions to construct one-dimensional chains, then the other supramolecular interactions help the 1D chains to form three-dimensional net-works, which stabilize the crystal structure.

Experimental

DBPMF was synthesized by the reaction of 2,7-dibromofluorene (3.24 g, 0.01 mol) and 4-chloromethyl pyridine hydrochloride (1.64 g, 0.02 mol) in DMSO (70 ml). The title compound was obtained by the reaction of DBPMF (2.55 g, 5.0 mmol) and $HClO_4$ (0.26 ml, 5.0 mmol) in EtOH (50 ml). Single crystals suitable for x-ray measurements were obtained by recrystallization at room temperature.

Refinement

H atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H distances=0.93-0.97 Å, N—H distance=0.86Å and with U_{iso}=1.2-1.5U_{eq}.

Figures

Fig. 1. The structure of the title compound showing 30% probability displacement ellipsoids and the atom-numbering scheme.

4,4'-[(2,7-Dibromofluorene-9,9-diyl)dimethylene]dipyridinium bis(perchlorate)

Crystal data

$C_{25}H_{20}Br_2N_2^{2+}\cdot 2ClO_4^-$	$F(000) = 1408$
$M_r = 707.15$	$D_x = 1.847$ Mg m^{-3}
Monoclinic, $C2/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -C 2yc	Cell parameters from 25 reflections
$a = 15.605$ (3) Å	$\theta = 4$–$14°$
$b = 11.267$ (2) Å	$\mu = 3.45$ mm^{-1}
$c = 16.318$ (3) Å	$T = 295$ K
$\beta = 117.60$ (3)°	Block, yellow
$V = 2542.6$ (11) Å^3	0.25 × 0.20 × 0.18 mm
$Z = 4$	

Data collection

Enraf–Nonius CAD-4 diffractometer	2611 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.062$
graphite	$\theta_{max} = 27.5°$, $\theta_{min} = 3.1°$
ω/2θ scans	$h = -20\rightarrow 20$
Absorption correction: ψ scan (North *et al.*, 1968)	$k = -14\rightarrow 14$
$T_{min} = 0.441$, $T_{max} = 0.537$	$l = -21\rightarrow 21$
11835 measured reflections	3 standard reflections every 100 reflections
2915 independent reflections	intensity decay: none

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.103$	H-atom parameters constrained
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0681P)^2 + 0.5103P]$ where $P = (F_o^2 + 2F_c^2)/3$
2915 reflections	$(\Delta/\sigma)_{max} = 0.001$
177 parameters	$\Delta\rho_{max} = 1.01$ e Å^{-3}

0 restraints $\Delta\rho_{min} = -0.79$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

2,4,6-Triphenylaniline

Onome Ugono, Stephanie Cowin and Alicia M. Beatty*

Department of Chemistry and Biochemistry, Center for Nanoscience, University of Missouri-St. Louis, St. Louis, Missouri, USA
Correspondence e-mail: beattya@umsl.edu

Received 14 May 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.001 Å; R factor = 0.043; wR factor = 0.125; data-to-parameter ratio = 29.6.

Individual molecules of the title compound, $C_{24}H_{19}N$, do not participate in hydrogen-bonding interactions due to the steric bulk of the phenyl rings *ortho* to the amine. The dihedral angles between the central ring and the pendant rings are 68.26 (10), 55.28 (10) and 30.61 (11)°.

Related literature

The reaction of equimolar amounts of pyrazole-3,5-dicarboxylic acid (HPzDCA) and primary amines have yielded ammonium carboxylate salts that adopt layered architectures, see: Ugono *et al.* (2009); Beatty *et al.* (2002*a*,*b*). For other amines that do not exhibit intermolecular hydrogen bonding due to the bulky *ortho* phenyl groups, see: Cherian *et al.* (2005); Lonkin & Marshal (2004). For the preparation of 2,4,6-triphenylaniline, see: Basu *et al.* (2003); Paul & Clark (2003).

2,4,6-Triphenylaniline

O. Ugono, S. Cowin and A. M. Beatty

Comment

The reactions of equimolar amounts of pyrazole-3,5-dicarboxylic acid (HPzDCA) and primary amines have yielded ammonium carboxylate salts that adopt layered architectures (Ugono *et al.*, 2009; Beatty *et al.*, 2002a,b). The level of structural fidelity for these organic salts allows, from a crystal engineering point of view, for the tuning of material properties by changing the identity of the organic group for the amines employed in the reaction. The reaction of pyrazole-3,5-dicarboxylic acid and 2,4,6-triphenylaniline (TPA) does not produce appreciable amounts of the desired ammonium carboxylate salt. However, large colorless single crystals of the aniline were obtained and structurally characterized.

The title compound packs in the monoclinic space group $P\,2_1/c$, with one molecule in the asymmetric unit. TPA does not self aggregate *via* intermolecular hydrogen bonds in the solid state. This lack of significant intermolecular hydrogen bonds appears to be due to the bulky *ortho* phenyl groups. These groups ensure that the distance requirements for hydrogen bond interactions are not satisfied, as potential participating hydrogen bonding donors and acceptors can not approach each other. This is not uncommon, as other amines, namely 2,6-bis(Benzofuran-2-yl)phenylamine (Lonkin *et al.*, 2004) and (*R*,*R*)-2,6-bis(1-Phenylethyl)4-methylaniline (Cherian *et al.*, 2005) among others, exhibit this characteristic for identical reasons.

Experimental

Into a 20 ml scintillation vial was placed 65 mg (37 mmol s) of pyrazole-3,5-dicarboxylic acid, 120 mg (37 mmol s) of 2,4,6-triphenylaniline (Basu *et al.*, 2003; Paul & Clark, 2003) and 5 ml of a 3:2 ethanol:water mixture. The mixture was warmed gently until the solution became clear and then filtered. The filtrate was placed in another scintillation vial, and colorless single crystals of the title compound were obtained in 48 h.

Refinement

All non hydrogen atoms were refined anisotropically. Phenyl hydrogen atoms were placed in calculated positions and treated with a riding model C–H= 0.95 Å, $U_{iso}(H_{aryl})= 1.2U_{eq}(C)$ for aromatic carbons. Amine hydrogen atoms were also placed in calulated positions and treated with a riding model N–H= 0.88 Å, $U_{iso}(H_{amine})= 1.2U_{eq}(N)$.

$V = 1740.7$ (6) Å^3	Prism, colorless
$Z = 4$	0.50 × 0.50 × 0.25 mm

Data collection

Bruker SMART APEXII diffractometer	6695 independent reflections
Radiation source: fine-focus sealed tube	5813 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.027$
ω scans	$\theta_{max} = 33.9°$, $\theta_{min} = 2.1°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -16 \rightarrow 16$
$T_{min} = 0.966$, $T_{max} = 0.983$	$k = -23 \rightarrow 23$
44061 measured reflections	$l = -18 \rightarrow 18$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.125$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0697P)^2 + 0.5511P]$ where $P = (F_o^2 + 2F_c^2)/3$
6695 reflections	$(\Delta/\sigma)_{max} = 0.001$
226 parameters	$\Delta\rho_{max} = 0.48$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.23$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2. Conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors (gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4-[(*E*)-({4-[Bis(2-hydroxyethyl)amino]-phenyl}imino)methyl]phenol

Xiaoju Liu, Bingqin Yang* and Maxim V. Borzov

Key Laboratory of Synthetic and Natural Chemistry of the Ministry of Education, College of Chemistry and Material Science, the North-West University of Xi'an, Taibai Bei Avenue 229, Xi'an 710069, Shaanxi Province, People's Republic of China
Correspondence e-mail: yangbq@nwu.edu.cn

Received 17 May 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.002 Å; R factor = 0.047; wR factor = 0.109; data-to-parameter ratio = 25.4.

In the title compound, $C_{17}H_{20}N_2O_3$, the amino N atom is in a planar environment (sum of angles = 360.0°). All hydroxy H atoms are involved in hydrogen bonding. In the crystal structure, two O—H···O and an O—H···N_{imino} hydrogen bond result in the formation of a three-dimensional network. The latter hydrogen bonding causes distortion of the planarity of the 4-HO–C_6H_4–CH=N–C_6H_4– fragment by rotation around the =N—C_{Ph} bond. The crystal studied was a non-merohedral twin [refined BASF parameter for the major component = 0.5293 (7)].

4-[(*E*)-({4-[Bis(2-hydroxyethyl)amino]phenyl}imino)methyl]phenol

X. Liu, B. Yang and M. V. Borzov

Comment

Schiff bases of general type *p*-R'–C_6H_4–CH=N–C_6H_4–R"-*p* are well-known objects that find their practical application in various areas [photography (for instance, see von König *et al.*, 1982), medicinal and pharmaceutical chemistry (for instance, see Haldavanekar *et al.*, 2009; Ferlin *et al.*, 2004; Lewis *et al.*, 2009)]. Recently we were interested in preparation of a series of 2,2'-(4-{[(1*E*)-phenylmethylene]amino}phenylimino)bisethanols as semi-products for their further conversion into paracyclophanes. This way, 4-[(*E*)-({4-[bis(2-hydroxyethyl)amino]phenyl}imino)methyl]phenol, $C_{17}H_{20}N_2O_3$, (I), and 2,2'-(4-{[(1*E*)-(4-methoxyphenyl)methylene]amino}phenylimino)bisethanol, $C_{18}H_{22}N_2O_3$, [II; Liu *et al.* (2010)], were prepared by a condensation reaction between 2,2'-[(4-aminophenyl)imino]bisethanol and 4-methoxy- or 4-hydroxybenzaldehyde, respectively (see Scheme).

Despite of the fact that structurally characterized Schiff bases of general type *p*-R'–C_6H_4–CH=N–C_6H_4–R"-*p* are well presented in the Cambridge Structural Database [CSD; Version 5.27, release February 2009; Allen, 2002; 128 entries, 173 fragments], among them there are only two compounds with R" = *N*(alkyl)$_2$ [namely: R' = H, R" = NEt_2 (Nagao *et al.*, 2002) and R' = NO_2, R" = NMe_2 (Nakai *et al.*, 1976)]. From this viewpoint, X-ray single crystal study of (I) presents a certain descriptive interest.

The asymmetric unit of (I) is shown in Fig. 1. Except of dihedral angle C7–N1–C8–C9, asymmetric units of (I) and [II; Liu *et al.* (2010)] have nearly identical geometries (Supplementary materials). Bond lengths, valency angles and C4–C7–N1–C8 torsion angle values for C4/C7/N1/C8 fragment match well the reported median values for *p*-R'–C_6H_4–CH=N–C_6H_4–R"-*p* [analysis of the Cambridge Structural Database (CSD); Version 5.27, release February 2009; Allen, 2002; 128 entries, 173 fragments]. Fragments O1/C1—C7/N1 and C8—C13/N2/C14/C16 are nearly planar [within 0.04 and 0.07 Å for (I)]. Atom N2 is also in a planar environment [sum of the valent angles 360.0 (6)°] what presents the most frequent case for aryldialkylamines (range from 317.6 to 360.0°, median value 359.0°)..

All hydroxy H-atoms in (I) are involved into hydrogen bonding [for the H-bonds lengths and angles values see the Table 1]. This way, O1—H1···O3 H-bonds assemble the molecules in chains stretched along the *c*-axis of the crystal lattice [linked molecules are connected by a simple (0,0,±1) translation]. These chains, in their turn, assemble into "foldered" zigzag layers parallel to the *a*0*b* face due to O2—H2···N1 bonds (see Fig. 2). Finally, O3—H3···O2 bonds join the adjacent layers what completes the entire 3D-framework (see Fig. 3). Involving of the N1 imino-atom into H-binding, evidently, causes a considerable distortion of the 4-HO–C_6H_4–CH=N–C_6H_4– fragment planarity by rotation around the ═N—C_{Ph} bond.

Experimental

1-Chloro-4-nitrobenzene, 4-methoxy- and 4-hydroxybenzaldehydes, 2,2'-iminobisethanol, ammonium formate, 10% Pd/C catalyst and solvents were purchased from Sinopharm Chemical Reagent and Tianjin Fuyu Chemical companies. 2,2'-[(4-nitrophenyl)imino]bisethanol was prepared as described by Cho & Park (1997) and Ferlin *et al.* (2004). Reduction of the

nitro-group was carried out as described by Lewis *et al.* (2009). Schiff-base preparation was done closely to what described by von König *et al.* (1982). – ^{1}H NMR spectra were recorded on a Varian INOVA-400 instrument in CD_3OD at 298 K using the resonance of the residual solvent protons as an internal reference [δ(H) = 3.30 ppm]. Procedure: 1-chloro-4-nitrobenzene (15.76 g, 0.10 mol) was dissolved in 2,2'-iminobisethanol (50 ml). The reaction mixture was heated at 393 K for 10 h, cooled down to room temperature, the precipitated crude 2,2'-[(4-nitrophenyl)imino]bisethanol filtered off, dried in vacuum and recrystallized from minimal amount of hot ethanol. Yield 11.54 g (51%). 2,2'-[(4-nitrophenyl)imino]bisethanol (8.15 g, 0.036 mol) was dissolved in MeOH (50 ml). To this solution, $HCOONH_4$ (0.216 mol) and 10% Pd/C (0.6 g) were added and the slurry was stirred at 293 K for 30 min. On removal of the catalyst by filtration, the filtrate was placed into a N_2-flushed flask containing 1 ml of acetic acid and an equimolar (0.036 mol) amount of 4-hydroxybenzaldehyde (0.036 mol) was added dropwise at 333 K during 30 min. The reaction mixture was kept at the same temperature for additional 30 min, cooled down to 273 K and ice-cold water (200 ml) was added. The precipitated light-green (I) solid was collected by filtration, washed with water, dried under reduced pressure and, finally, re-crystallized by a slow evaporation of their methanol solutions in air at 293 K. Yield 92%, m.p. 476 K. ^{1}H NMR for (I) δ: 8.45 (s, 1H, CH═N), 6.78–7.73 (m, 8H, C_6H_4), 3.30, 3.74 (both t, 4 H and 4 H, $^3J_{HH}$ = 7.2 Hz, CH_2). Single crystal of (I) suitable for X-ray diffraction analysis was picked up directly from the obtained materials.

Refinement

All non-H atoms were refined anisotropically. H atoms except of H7 and OH group ones were treated as riding atoms with distances C—H = 0.97 (CH_2), 0.93 Å ($C_{Ar}H$), and U_{iso}(H) = 1.2U_{eq}(C). Atoms H7 and OH group H atoms were found from difference Fourier syntheses and refined isotropically.

Figures

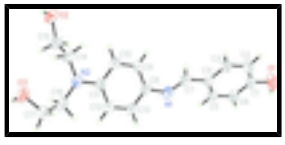

Fig. 1. Asymmetric unit of the compound (I) with labelling and thermal ellipsoids at the 50% probability level.

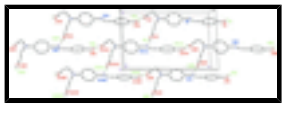

Fig. 2. Assembling of the molecules of (I) into a "foldered" zigzag layer. Hydrogen atoms except of the OH ones are omitted for clarity. Labelling is provided only for atoms involved in H-bonding. H-bonds are depicted as dashed lines.

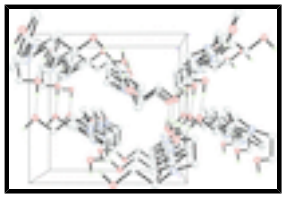

Fig. 3. Inter-layer assembling of the molecules of (I) into a 3D-network. Hydrogen atoms except of the OH ones are omitted for clarity. Only O3—H3···O2^{iii} [symmetry code: (iii) –x + 1.5, y + 0.5, –z + 0.5] bonds and their symmetry equivalents are depicted (dashed lines).

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.047$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.109$	$w = 1/[\sigma^2(F_o^2) + (0.0702P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.84$	$(\Delta/\sigma)_{max} < 0.001$
5506 reflections	$\Delta\rho_{max} = 0.16$ e Å^{-3}
217 parameters	$\Delta\rho_{min} = -0.18$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0107 (15)

Special details

Experimental. Sample of (I) was a two-component non-merohedral twin with approximately equal component contribution. Thus, the structure of (I) was solved and pre-refined for one of the components (HKLF 4 format) and finally refined for the full set of reflexions (HKLF 5 file format). The refined BASF parameter for the prevailing component equals 0.5293 (7).

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

2′,3,4,4′-Tetramethoxychalcone

Johannes H. van Tonder, Theunis J. Muller* and Barend C. B. Bezuidenhoudt

Department of Chemistry, University of the Free State, PO Box 339, Bloemfontein, 9300, South Africa
Correspondence e-mail: Muller.theunis@gmail.com

Received 17 May 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.044; wR factor = 0.188; data-to-parameter ratio = 18.7.

In the title compound [systematic name: 1-(2,4-dimethoxyphenyl)-3-(3,4-dimethoxyphenyl)prop-2-en-1-one], $C_{19}H_{20}O_5$, the dihedral angle between the benzene rings is 26.88 (5)°. One of the methoxy groups is twisted slightly away from the plane [C—O—C—C torsion angle = −12.8 (3)°] while the others are almost co-planer [C—O—C—C torsion angles = −3.2 (3), 2.6 (3) and −3.6 (3)°]. The crystal packing is stabilized by intermolecular C—H···O interactions. A weak intramolecular C—H···O interaction occurs.

2',3,4,4'-Tetramethoxychalcone

J. H. van Tonder, T. J. Muller and B. C. B. Bezuidenhoudt

Comment

Flavonoids are a prominent class of secondary plant metabolites known for their wide range of biological active compounds that exibit antibacterial, antifugal, antitumor and anti-inflammatory properties (Pietta *et al.*, 2003). Chalcones are an important subclass of these compounds and are often utilized as intermediates in the synthesis of a variety of cyclic flavonoids (Marais *et al.*, 2005). Furthermore, many chalcone derivatives are known to have excellent non-linear optical (NLO) properties (Fichou *et al.*, 1988; Uchida *et al.*, 1998; Patil *et al.*, 2006*a*,b). We report here a new chalcone which we have successfully synthesized (the title compound, (I)). Bond distances in (I) have normal values (Allen *et al.*, 1987) and bond angles and distances are comparable to those in related structures (Teh *et al.*, 2006*a*,b,c; Patil *et al.*, 2006*a*,b,c; Rosli *et al.* 2006). The least squares plane through the enone group (C7, C8, C9 and O3) exhibit dihedral angles of 29.2 (1)° and 4.5 (1)° with the C1—C6 and C10—C15 benzene rings, respectively. The dihedral angle between the two benzene rings is 26.88 (5)°. The methoxy group attached at C1 is slightly twisted away from the C1—C6 benzene ring plane, with a C16—O1—C1—C2 torsion angle of -12.8 (3)°. The methoxy groups at C3, C12 and C13 are almost co-planar with the C1—C6 and C10—C15 benzene rings with C17—O2—C3—C2, C18—O4—C12—C11 and C19—O5—C13—C14 torsion angels of -3.2 (3)°, 2.6 (3)° and -3.6 (3)°, respectively. An intramolecular C8—H8···O1 hydrogen bond is observed in the molecular structure of (I), while the molecules form chains through intermolecular C18—H18B···O3^{i} hydrogen bonds (Table 1).

Experimental

The title compoud was synthesized according to the procedure by Kraus *et al.* (2008) Freshly ground KOH (1.55 g; 27.80 mmol; 5 eq.) was added to a cold (ice bath) stirring solution of 2',4'-dimethoxyacetophenone (1.00 g; 5.56 mmol) and 3,4-dimethoxybenzaldehyde (1.13 g; 7.12 mmol; 1.2 eq.) in EtOH (40 ml). The reaction mixture was allowed to heat to room temperature and stirred to completion (TLC). Ice was added to the reaction mixture prior to acidification with concentrated HCl (litmus). Extraction was performed with EtOAc (3 *x* 100 ml) and the organic fractions combined. The organic phase was neutralized with a saturated solution of $NaHCO_3$ (litmus), washed with water, dried (Na_2SO_4) and evaporated *in vacuo* at *ca* 40 °C. Crystallization from EtOH afforded the desired chalcone (1.55 g; 84.7%) as yellow needles. R_f 0.16 (H:A; 8:2); Mp 88.3 °C; ^{1}H NMR (600 MHz, $CDCl_3$) δ 7.69 (1*H*, d, *J* = 8.61 Hz, H-6'), 7.58 (1*H*, d, *J* = 15.71 Hz, H-β), 7.33 (1*H*, d, *J* = 15.71 Hz, H-α), 7.14 (1*H*, dd, *J* = 1.92, 8.32 Hz, H-5), 7.08 (1*H*, d, *J* = 1.92 Hz, H-2), 6.84 (1*H*, d, *J* = 8.32 Hz, H-6), 6.52 (1*H*, dd, *J* = 2.25, 8.61 Hz, H-5'), 6.46 (1*H*, d, *J* = 2.25 Hz, H– 3'), 3.88 (3*H*, s, –OCH_3), 3.87 (3*H*, s, –OCH_3), 3.85 (3*H*, s, –OCH_3), 3.82 (3*H*, s, –OCH_3); ^{13}C NMR (151 MHz, $CDCl_3$) δ 190.58, 163.96, 160.21, 150.95, 149.11, 142.34 (C-β), 132.63 (C-6'), 128.39, 125.28 (C-α), 122.60 (C-5), 122.36, 111.13 (C-6), 110.24 (C-2), 105.14 (C-5'), 98.66 (C-3'), 55.94 (–OCH_3), 55.86 (–OCH_3), 55.71 (–OCH_3), 55.50 (–OCH_3).

Refinement

The aromatic H atoms were placed in geometrically idealized positions and constrained to ride on its parent atoms with U_{iso} (H) = 1.2U_{eq}(C) and at a distance of 0.93 Å. The hydrogen atoms of the methine (H8 and H9) group were determined from a difference Fourier map and their positional parameters freely refined (C8—H8 = 0.96 (2)Å and C9—H9 = 1.01 (2) Å). The methyl H atoms were placed in geometrically idealized positions and constrained to ride on its parent atoms with U_{iso}(H) = 1.5U_{eq}(C) and at a distance of 0.96 Å.

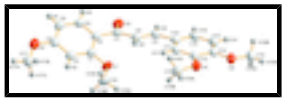

Fig. 1. Representation of the title compound, showing the numbering scheme and displacement ellipsoids (50% probability).

1-(2,4-dimethoxyphenyl)-3-(3,4-dimethoxyphenyl)prop-2-en-1-one

Crystal data

$C_{19}H_{20}O_5$	$F(000) = 696$
$M_r = 328.35$	$D_x = 1.293$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 7154 reflections
$a = 12.5839$ (7) Å	$\theta = 2.4$–$23.6°$
$b = 11.7204$ (7) Å	$\mu = 0.09$ mm^{-1}
$c = 12.1339$ (6) Å	$T = 100$ K
$\beta = 109.489$ (2)°	Plate, colourless
$V = 1687.07$ (16) Å^3	0.49 × 0.22 × 0.07 mm
$Z = 4$	

Data collection

Bruker APEXII diffractometer	2539 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.039$
phi and ω scans	$\theta_{max} = 28.4°$, $\theta_{min} = 1.7°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2008)	$h = -16 \rightarrow 16$
$T_{min} = 0.976$, $T_{max} = 0.994$	$k = -15 \rightarrow 15$
32681 measured reflections	$l = -11 \rightarrow 16$
4205 independent reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.044$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.188$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.12$	$w = 1/[\sigma^2(F_o^2) + (0.0998P)^2 + 0.0628P]$ where $P = (F_o^2 + 2F_c^2)/3$
4205 reflections	$(\Delta/\sigma)_{max} = 0.001$
225 parameters	$\Delta\rho_{max} = 0.21$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.20$ e Å^{-3}

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 200 K; mean σ(C–C) = 0.015 Å; disorder in main residue; R factor = 0.050; wR factor = 0.094; data-to-parameter ratio = 19.1.

The unusual trinuclear Au^{III} oxide title complex, $[Au_3Cl_6O(C_{21}H_{24}N_2)_3](C_2F_6NO_4S_2)\cdot 2[Ag(C_2F_6NO_4S_2)]$, is the side product of the reaction of [1,3-bis(1,3,5-trimethylphenyl)-imidazol-2-ylidene]dichloridophenylgold(III) with silver bis(trifluoromethanesulfonyl)imide in the presence of traces of water. In contrast to corresponding Au^{I} complexes, the core structure of the title compound is planar. Two silver(I) bis(trifluoromethanesulfonyl)imide units are loosely bound to the complex cation. Here the silver atoms, disordered over two positions in a 0.870 (2):0.130 (2) ratio, interact either with the lone pairs of three chlorine ligands or two chlorine ligands and one edge of the mesityl π-system. The crystal under investigation was a partial racemic twin.

Comment

The structure of the title compound consists of a trinuclear complex cation around a central oxygen atom with a trigonal planar Au^{III} environment. Loosley bound to this cation are two silver bis(trifluoromethanesulfonyl)imide moieties with a twofold disordered silver position. Finally there is another free bis(trifluoromethanesulfonyl)imide anion to compensate the charge of the cation. Although tris[(phosphane)gold(I)]oxonium ions are a well known source for LAu+ as shown by Nesmeyanov *et al.* (1980), to the best of our knowledge there have been no reports on trimeric $[Au_3O]^+$ complexes with N-heterocyclic carbenes or generally $[Au^{III}O]^+$ complexes in the literature before.

Both, the trinuclear cation and the free imide anion reside at a special position on a crystallographic twofold axis. The non-crystallographic symmetry of the cation is D_3. Thus, in contrast to corresponding $[(LAu^I)_3O]^+$ complexes with pyramidal geometry (*e.g.* Yang *et al.*, 1993; Schmidbaur *et al.*, 1993; Angermaier & Schmidbaur, 1994, 1995), the structure of the $Au^{III}{}_3O$ core of the title compound is flat. Therefore the Au···Au distances are with 3.4655 (5) and 3.5688 (6) Å necessarily much longer than in the Au^I complexes and we assume no aurophilic interactions. The Au—O distances amount to 2.046 (7) and 2.010 (3) Å, the Au—C_{NHC} distances to 2.018 (12) and 1.982 (7) Å. The Cl—Au—Cl axes are inclined with respect to the Au_3O plane by about 37.0° and 42.0°, which leads to a octahedral chlorine environment for the central oxygen atom with Cl···O distances between 2.986 (5) and 2.996 (5) Å, which is clearly below the van der Waals distance (3.27 Å). As already mentioned two $Ag[N(SO_2CF_3)_2]$ units are loosley bound to this cation. Remarkably there are two alternative positions for the silver center which are occupied by 87% and 13% resp. At the main position the silver is in contact with three chlorine atoms of the cation (Ag···Cl between 2.644 (2) and 2.769 (3) Å), at the alternative position among two chlorine atoms (Ag···Cl 2.302 (8) and 2.754 (8) Å) the silver contacts one edge of the mesityl π-system (Ag···C 2.544 (12) and 2.587 (13) Å). The distorted tetrahedral environment of the silver centers is completed in both cases remarkably with an oxygen atom of the bis(trifluoromethanesulfonyl)imide anion (Ag···O 2.340 (7) and 2.342 (10) Å) rather than the nitrogen. This unexpected coordination mode of the bis(trifluoromethanesulfonyl)imide anion has been observed before by Nockemann *et al.* (2008).

Experimental

To a solution of phenyldichloro-1,3-bis(1,3,5-trimethylphenyl)imidazol-2-ylidene gold(III) (20 mg, 30.8 µmol) in dry d2-dichloromethane, as described by Pažický *et al.* (2010), silver bis(trifluoromethanesulfonyl)imide (12 mg, 30.8 µmol) was added at room temperature. The solution was stirred for five minutes and filtered over celite. Yellow crystals of the title compound besides white crystals of dichloro-1,3-bis(1,3,5-trimethylphenyl)imidazol-2-ylidene gold(III) bis(trifluoromethanesulfonyl)imide were obtained by slow diffusion of the concentrated filtrate of the crude product into pentane at 8 °C.

Refinement

Rigid bond restraints were applied to the U^{ij} values of the nitrogen atom N2 and its surrounding carbon atoms C1, C3, and C11 as well as an isotropic restraint (ISOR) to N2. These prevents atom N2 from going non positive definite. The rest of the adps of the structure was not restrained, as these looked rather reasonable. We can give no convincing explanation for the unsatisfying behavior of N2 and its environment. But in return there is also no plausible possibilty for misinterpretation or atom misassignment here. Obviously the data just results in unrealistic adps in this part of the structure for some reason.

Hydrogen atoms were placed in calculated positions (C–H 0.95– 0.98 Å) and were included in the refinement in the riding model approximation with U_{iso}(H) set to 1.2–1.5 U_{eq}(C). A model with staggered conformation with respect to the closest substituent was used for the phenyl-bound methyl groups, which may lead to some ambiguity.

The nature of the disordered silver atom was not clear at first. There were several reasons that led us to the present interpretation. First of all silver bis(trifluoromethanesulfonyl)imide was present in the solution as the only species with an electrophilic atom besides of gold. Furthermore the coordination behaviour to the aromatic π-system and/or to the chlorine ligands as well as to the anion fits fine to the well known geometry of other silver complexes. And finally the refinement of a model with two alternative and partially occupied silver positions converged very well with completely reasonable occupation and displacement parameters.

The refinement of the Flack parameter (Flack, 1983) resulted in a value of 0.396 (7), indicating partial racemic twinning of the crystal.

Figures

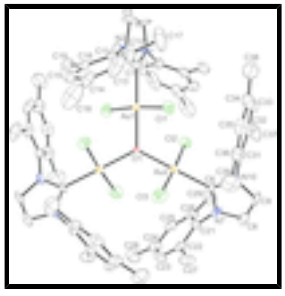

Fig. 1. Thermal ellipsoid representation of the trinuclear oxo cation of the title compound. Displacement ellipsoids were plotted at 50% probability level. Hydrogen atoms, the anion and the silver moiety are omitted for the sake of clarity.

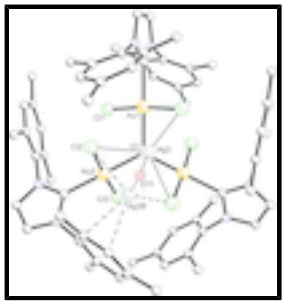

Fig. 2. Both alternative silver positions (87% Ag3:13% Ag3B) and their coordination modes to the trinuclear oxo cation in a simple ball and stick representation. From the bis(trifluoromethanesulfonyl)imide anion coordinated to the silver only the coordinating oxygen atom (O11) is shown for clarity. Due to the 2-fold symmetry the same pattern is found at the reverse side of the cation, which is omitted for the sake of clarity as well.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 22 May 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.006 Å; R factor = 0.048; wR factor = 0.132; data-to-parameter ratio = 13.2.

The title compound, $C_{16}H_{12}FN_3OS$, was synthesized by the reaction of 5-(4-methoxyphenyl)-1,3,4-thiadiazol-2-amine and 4-fluorobenzaldehyde. An intramolecular C—H···S hydrogen bond results in the formation of two five-membered rings. In the crystal structure, intermolecular C—H···N hydrogen bonding links the molecules, forming a two-dimensional network.

Comment

1,3,4-Thiadiazole derivatives represent an interesting class of compounds possessing broad spectrum biological activities (Nakagawa *et al.*, 1996; Wang *et al.*, 1999). These compounds are known to exhibit diverse biological effects, such as insecticidal, fungicidal activities (Wang *et al.*, 1999).

We report herein the crystal structure of the title compound,(I). In the molecule of the title compound (Fig. 1), bond lengths are within normal ranges. Rings A(C2—C7), B(S/C9/N2/N3/C10) and C(C11—C16) are planar. The dihedral angle between them is A/B = 21.4 (1) Å, A/C=29.6 (3)Å and B/C= 10.7 (4) Å. The intramolecular C—H···S hydrogen bonds (Table 1) result in the formation of two planar five-membered rings D(H8A/C8/N1/C9/S) and E(S/H12A/C12/C11/C10). They are oriented with respect to the adjacent rings at dihedral angles of A/D= 11.6 (4) Å, B/D= 14.1 (4) Å, C/D= 24.5 (1) Å, A/E= 27.4 (1) Å, B/E= 6.1 (1) Å, C/E= 8.2 (1)Å and D/E= 19.5 (1) Å. In the crystal structure, intermolecular C—H···S hydrogen bond (Table 1) links the molecules to form a two-dimensional network (Fig. 2), in which they may be effective in the stabilization of the structure.

Experimental

5-(4-methoxyphenyl)-1,3,4-thiadiazol-2-amine(5 mmol) and 4-fluorobenzaldehyde(5 mmol) were added in toluene (50 ml). The water was removed by distillation for 5 h. The reaction mixture was left to cool to room temperature, filtered, and the filter cake was crystallized from acetone to give pure compound (I) (m.p. 412–414 K). Crystals of (I) suitable for X-ray diffraction were obtained by slow evaporation of an acetone solution.

Refinement

All H atoms bonded to the C atoms were placed geometrically at the distances of 0.93–0.97 Å and included in the refinement in riding motion approximation with $U_{iso}(H) = 1.2_{eq}$ of the carrier atom.

Figures

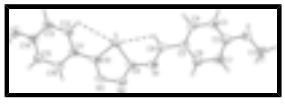

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. Hydrogen bonds are shown as dashed line.

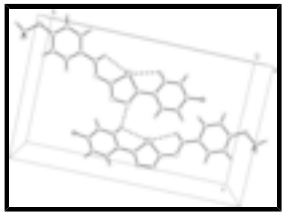

Fig. 2. A partial packing diagram of(I). Hydrogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.048$	H-atom parameters constrained
$wR(F^2) = 0.132$	$w = 1/[\sigma^2(F_o^2) + (0.078P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{max} < 0.001$
2617 reflections	$\Delta\rho_{max} = 0.33$ e Å^{-3}
199 parameters	$\Delta\rho_{min} = -0.17$ e Å^{-3}
1 restraint	Absolute structure: Flack (1983), 1062 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: −0.11 (13)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 27 May 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.007 Å; R factor = 0.050; wR factor = 0.101; data-to-parameter ratio = 14.3.

The five-coordinate Sn^{IV} atoms in the two crystallographically independent molecules of the title compound, [Sn(C$_4$H$_9$)$_2$(C$_{19}$H$_{13}$ClN$_2$O$_3$)], are in distorted *cis*-C$_2$NO$_2$Sn trigonal-bipyramidal coordination environments. The tridentate dianion of the Schiff base, *N*′-[1-(5-chloro-2-oxidophenyl)-ethylidene]-3-hydroxy-2-naphthohydrazide, displays intermolecular O—H···N hydrogen bonding, which stabilizes the overall compound.

Dibutyl{*N*'-[1-(5-chloro-2-oxidophenyl-κ*O*)ethylidene]-3-hydroxy-2-naphthohydrazidato-κ^2N',O^2}tin(IV)

S. M. Lee, H. Mohd Ali and K. M. Lo

Comment

Schiff bases derived from substituted salicylaldehydes have been widely used as polydentate ligands in the preparation of metal complexes. The metal complexes of these hydrazones with substituted salicylaldehydes are known to possess potential biological activities such as antifungal, anticancer and many others [Bernhardt *et al.* (2006), Ainscough *et al.* (1999), Mohd Ali *et al.* (2004)]. We have earlier reported the synthesis and molecular structure of a diphenyltin complex of the Schiff base derived from the reaction of 3-hydroxy-2-naphthoic hydrazide with 5-chlorobenzaldehyde [Lee *et al.* (2009)]. The crystal structure of this complex consists of discrete molecules in which the tin atom is *O,N, O'*-chelated by the deprotonated Schiff base ligand. As an extension of our work in structural characterization of organotin with hydrazones, we report here the molecular structure of a dibutyltin complex of a Schiff base derived from the reaction of 3-hydroxy-2-naphthoic hydrazide with 5-chloro-2-hydroxyacetophenone. The unit cell of the title complex consists of two crystallographically independent molecules. In both molecules, the Schiff base ligand, *N'*-[1-(5-chloro-2-oxidophenyl)ethylidene-3-hydroxy-2-naphthohydrazone] forms a tridentate dianion which coordinated to the dibutyltin fragment in a distorted *cis*-C_2NO_2Sn trigonal bipyramidal configuration; the axial O—Sn—O angle are 153.03 (13)^o and 152.41 (13)^o.

Experimental

The Schiff base ligand was prepared by the condensation reaction of 3-hydroxy-2-naphthoic hydrazide with 5-chloro-2-hydroxyacetophenone. The prepared Schiff base (0.74 g, 2.0 mmol), dibutyltin dichloride (0.61 g, 2 mmol) and triethylamine (0.6 ml) were refluxed in 50 ml of ethanol for 5 h. The solution was left for crystallizaton at room temperature during which yellow crystals were obtained.

Refinement

Hydrogen atoms were placed at calculated positions (C–H 0.95 to 0.98 Å) and were treated as riding on their parent carbon atoms, with *U*(H) set to 1.2–1.5 times U_{eq}(C). The hydroxy-H was refined with a restraint of 0.84 ± 0.01 Å.

Figures

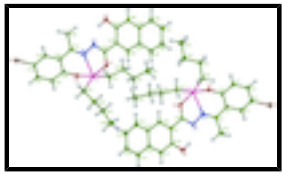

Fig. 1. The molecular structure of {*N*'-[1-(5-chloro-2-oxidophenyl-κ*O*)ethylidene]-3-hydroxy-2- naphthohydrazidato-κ^2N',O}dibutyltin(IV) showing 50% probability displacement ellipsoids and the atom numbering. Hydrogen atoms are drawn as spheres of arbitrary radius.

0 restraints	$\Delta\rho_{min} = -1.50$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes)

are estimated using the full covariance matrix. The cell e.s.d.'s are taken

into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

Correspondence e-mail: maguireg@ukzn.ac.za

Received 27 May 2010; accepted 9 June 2010

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.003 Å; R factor = 0.030; wR factor = 0.076; data-to-parameter ratio = 8.0.

The asymmetric unit cell of the title compound, $C_{18}H_{18}N_2O$, contains four molecules. In the crystal structure, an intermolecular N—H···N hydrogen bond helps to establish the packing.

Comment

Heterocyclic rings play roles in a number of key areas of organic and inorganic chemistry. As part of an ongoing study into the asymmetric hydrogen transfer reactions we made a series of ligands (Chakka *et al.*, 2010). The title compound (**I**) is one such molecule (Fig 1). It combines for the first time two important heterocyclic rings into a single structure, namely oxazoline (Hargaden *et al.*, 2009) and tetraisoquinoline (TIQ), (Scott *et al.*, 2002). The asymmetric unit cell contains four molecules. There are inter-molecular N(1)—H···N(1) bond interactions (2.212 Å) that hold the structure in two dimensional planes. The intermolecular distance value between ring centroids in the *b* axis direction (5.402 Å), suggests that there is no π-stacking interaction between parallel molecules (Fig 2).

Experimental

A solution of Cbz-protected TIQ–oxazoline (1.0 g, 2.89 mmol) in methanol (30 ml) was added to a suspension of 10 wt.% Pd/C (0.5 g) in methanol (10 ml). The reaction mixture was connected to an H_2 source at atmospheric pressure and stirred at room temperature for 3 h. Completion of the reaction was monitored by TLC using hexane/ethyl acetate (7:3) with the R_f = 0.6. The Pd/C was filtered off over a celite pad and the filtrate was concentrated under reduced pressure to afford crude (**I**). The title compound was purified on a deactivated silica gel column packed with a suspension of silica gel in 20% Et_3N/CH_2Cl_2. The silica was washed with 1% Et_3N/CH_2Cl_2. The chromatography was then performed using 0–2% MeOH/1%Et_3N/CH_2Cl_2 as the eluent to afford TIQ-oxazoline product. *M*.p: 304 – 306 K.

^{1}H NMR (400 MHz, $CDCl_3$): δ 7.37–7.23 (m, 3H), 7.23–7.10 (m, 5H), 7.05 (m, 1H), 5.23 (t, J = 18.21 Hz, 1H), 4.68 (q, J = 10.10, 8.26 Hz, 1H), 4.16 (m, 3H), 3.92 (m, 1H), 3.10–3.05 (m, 2H); ^{13}C NMR (100 MHz, $CDCl_3$): δ 168.9, 142.0, 135.0, 133.3, 129.2, 128.7, 127.6, 126.5, 126.2, 126.1, 126.0, 69.4, 51.5, 47.6, 32.4.

IR (neat): 3225, 1663, 1493, 1108, 957, 907, 916, 740, 749, 697 cm^{-1}.

HR ESI MS: 279.1492 $[M + H]^+$ (calcd. for $C_{18}H_{19}N_2O$ 279.1512).

Refinement

All hydrogen atoms, except H1N on N1, were positioned geometrically with C—H = 0.95 - 1.00 Å and refined as riding on their parent atoms with U_{iso} (H) = 1.2 - 1.5 U_{eq} (C). The hydrogen atoms H1N were located in the difference electron density maps and refined with simple bond length constraint.

Figures

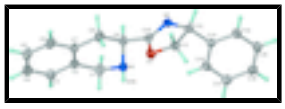

Fig. 1. Molecular structure of (**I**) showing numbering scheme. All non-hydrogen atoms are shown as ellipsoids with probability level of 50%.

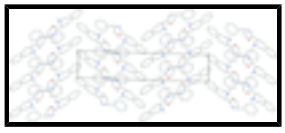

Fig. 2. Projection viewed along [010]. All hydrogen atoms except the hydrogen H1N on N1 are omitted. The hydrogen bonds are shown as dotted lines.

$M_r = 278.34$	$D_x = 1.292$ Mg m^{-3}
Orthorhombic, $P2_12_12_1$	Cu $K\alpha$ radiation, $\lambda = 1.54178$ Å
Hall symbol: P 2ac 2ab	Cell parameters from 6634 reflections
$a = 5.4023$ (3) Å	$\theta = 4.7$–$69.2°$
$b = 10.0999$ (6) Å	$\mu = 0.64$ mm^{-1}
$c = 26.2205$ (17) Å	$T = 173$ K
$V = 1430.66$ (15) Å^3	Needle, colourless
$Z = 4$	0.22 × 0.21 × 0.10 mm

Data collection

Bruker Kappa DUO APEXII diffractometer	1552 independent reflections
Radiation source: fine-focus sealed tube	1479 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.036$
Detector resolution: n/a pixels mm^{-1}	$\theta_{max} = 69.2°$, $\theta_{min} = 4.7°$
0.5° φ scans and ω scans	$h = -6 \rightarrow 6$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1997)	$k = -11 \rightarrow 12$
$T_{min} = 0.682$, $T_{max} = 0.753$	$l = -15 \rightarrow 30$
6634 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.030$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.076$	$w = 1/[\sigma^2(F_o^2) + (0.0436P)^2 + 0.1838P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{max} < 0.001$

1552 reflections	$\Delta\rho_{max}$ = 0.14 e Å^{-3}
195 parameters	$\Delta\rho_{min}$ = −0.12 e Å^{-3}
1 restraint	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0039 (5)

Special details

Experimental. Half sphere of data collected using *SAINT* strategy (Bruker, 2006). Crystal to detector distance = 50 mm; combination of φ and ω scans of 0.5°, 30 s per °, 2 iterations.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

Key indicators: single-crystal X-ray study; T = 292 K; mean σ(C–C) = 0.006 Å; R factor = 0.044; wR factor = 0.111; data-to-parameter ratio = 10.7.

In the title compound, $[Co_2(C_7H_2N_2O_7)_2(C_{19}H_{12}N_4)_2(H_2O)_2]$, the Co^{II} atom is six-coordinated by two N atoms from a 2-phenyl-1*H*-1,3,7,8,-tetraazacyclopenta[*l*]phenanthrene (*L*) ligand, three O atoms from two 3,5-dinitro-2-oxidobenzoate (3,5-dinitrosalicylate or DNSA) ligands and one O atom from a water molecule in a distorted octahedral geometry. The Co^{II} atoms are bridged by two carboxylate O atoms from two DNSA ligands, forming a centrosymmetric dinuclear structure. Neighbouring dinuclear units interact with each other through two types of π–π interactions between the *L* ligands [shortest centroid–centroid distance = 3.646 (3) Å] and between the *L* and DNSA ligands [shortest atom-to-centroid distance = 3.794 (3) Å]. N—H···O, O—H···N and O—H···O hydrogen bonds are observed, which lead to a three-dimensional structure.

Comment

Metal-organic coordination polymers have attracted increasing interest over the past decade because of their intriguing structures and tremendous potential applications in catalysis, molecular adsorption, nonlinear optics, magnetism, and so on (Che *et al.*, 2008). 1,10-Phenanthroline (phen) has been widely used to build supramolecular architectures owing to its excellent coordinating ability and large conjugated system. However, building blocks derived from the appropriate modification of phen, such as 2-phenyl-1*H*-1,3,7,8-tetra-azacyclopenta[l]phenanthrene (*L*) have received considerably less attention (Liu *et al.*, 2009). Hereby, we have prepared the title compound based on *L* and 3,5-dinitrosalicylic acid (H_2DNSA) ligands.

In the title compound, the Co^{II} atom is six-coordinated by two N atoms from one *L* ligand, four O atoms from two DNSA ligands and one water molecule (Fig. 1). The Co—O distances range from 1.991 (3) to 2.216 (3) Å and the Co—N lengths are 2.095 (3) and 2.102 (3) Å (Table 1). The N1, N2, O1, O3 atoms comprise the equatorial plane, while the $O1^i$ and OW1 atoms occupy the axial position [symmetry code: (i) -x, -y, 1-z]. A carboxylate O atom and the hydroxy O atom of the DNSA ligand coordinate to one Co atom, and this carboxylate O atom bridges the other Co atom, forming a dinuclear structure. The two nitro groups are uncoordinated.

It is noteworthy that various hydrogen bonds interactions are observed in the title compound. (a) An N—H···O hydrogen bond between the imidazole ring donor and the nitro group of the DNSA ligand (Table 2). (b) O—H···N or O—H···O hydrogen bonds involving the coordinated water molecule OW1 and the imidazole N3 and carboxylate O2 atoms (Table 2). In addition, two types of π–π stacking interactions further intensify the architectures. One is the offset face-to-face π–π interactions between the *L* ligands with the shortest centroid–centroid distance of 3.646 (3) Å, while the other exists between the *L* and DNSA ligands [shortest atom-to-centroid distance = 3.794 (3) Å] (Fig. 2), which lead to a three-dimensional supramolecular structure (Fig. 3).

Experimental

The *L* ligand was synthesized according to the literature method (Steck & Day, 1943). The title compound was synthesized under hydrothermal conditions. A mixture of *L* (0.06 g, 0.2 mmol), H_2DNSA (0.048 g, 0.2 mmol), $Co(NO_3)_2$ (0.036 g, 0.2 mmol) and water (10 ml) in a mole ratio 1:1:1:5000 was placed in a 25 ml Teflon-lined autoclave and heated for 3 d at 433 K under autogenous pressure. Upon cooling and opening the bomb, yellow block-shaped crystals were obtained, washed with H_2O and dried in air (yield 45% based on Co).

Refinement

H atoms on C and N atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 and N—H = 0.86 Å and with U_{iso}(H) = 1.2U_{eq}(C,N). H atoms of water molecule were located from a difference Fourier map and their positions and U_{iso} values were refined freely.

Figures

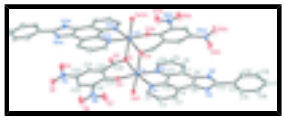

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level. H atoms have been omitted for clarity. [Symmetry code: (A) -x, -y, -z+1.]

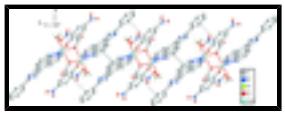

Fig. 2. View of the one-dimensional supramolecular chain generated by π–π interactions (dashed lines). H atoms except those of water molecules have been omitted for clarity.

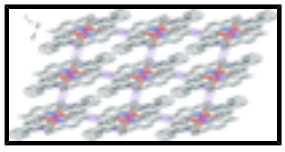

Fig. 3. View of a three-dimensional supramolecular structure with hydrogen bonds indicated by dotted lines. Most H atoms have been omitted.

Bis(μ-3,5-dinitro-2-oxidobenzoato)-$\kappa^3O^1,O^2:O^1$;$\kappa^3O^1:O^1,O^2$- bis[aqua(2-phenyl-1,3,7,8-tetraazacyclopenta[*l*]phenanthrene- κ^2N^7,N^8)cobalt(II)]

Azido(benzonitrile-κN)[hydridotris(pyrazol-1-yl-κN^2)borato](triphenylphosphine-κP)ruthenium(II)

Chiung-Cheng Huang,[a] Han-Gung Chen,[b] Yih Hsing Lo,[b]* Wen-Rong Lai[b] and Chia-Her Lin[c]

Key indicators: single-crystal X-ray study; T = 200 K; mean σ(C–C) = 0.006 Å; R factor = 0.041; wR factor = 0.093; data-to-parameter ratio = 13.6.

Facile ligand substitution is observed when the ruthenium–azide complex, $[RuN_3(Tp)(PPh_3)_2]$ [Tp,$HB(pz)_3$, pz = pyrazolyl, PPh_3 = triphenylphosphine] is treated with benzonitrile, yielding the title compound, $[Ru(C_9H_{10}BN_6)(N_3)(C_7H_5N)(C_{18}H_{15}P)]$. The asymmetric unit contains two crystallographically independent molecules. In each one, the Ru^{II} atom is six-coordinated in a distorted octahedral geometry by five N atoms from an htpb ligand, an azide ligand and a benzonitrile ligand and one P atom from a triphenylphosphine (tpp) ligand. The azide group is almost linear and is coordinated to Ru with an average Ru—N—N angle of 124.9 (3)°.

Comment

Organic azides are synthetically helpful reagents. Amongst many transformations, perhaps the most important one is the 1,3-dipolar cycloaddition reactions with alkynes to synthesize triazoles (Padwa, 1976). Triazoles are nitrogen heteroarenes, which have found a range of significant applications in pharmaceutical and agricultural industries (Krivopalov & Shkurko, 2005). On the other hand, the azide anion, N_3^- , is a versatile ligand because it shows a variety of coordination modes, e.g. end-on monodentate, one-end bridging and end-to-end bridging modes, and also because its complexes exhibit interesting thermal and photochemical reactivities (Dori & Ziolo, 1973; Huynh *et al.*, 2003; Meyer *et al.*, 1998).

The title compound contains two crystallographically distinct molecules (Fig. 1, Table 1). The azide groups are almost linear [N8—N9—N10 = 176.8 (4), N18—N19—N20 = 175.7 (4)°] and are coordinated to Ru with Ru—N—N angles of 123.8 (3) and 125.9 (3)°. There is a small difference between the N—N distances [1.172 (4), 1.188 (4) and 1.173 (4), 1.172 (4) Å]. The Ru1—N7 and N7—C28 bond lengths of 1.983 (3) and 1.150 (4) Å correspond to a single Ru—N bond and a C≡N bond. The N7—C28—C29 of angle 179.0 (4)° indicates an *sp* hybridization as expected.

Experimental

To a solution of $[RuN_3(htpb)(tpp)_2]$ (htpb = hydridotripyrazolylborate, tpp = triphenylphosphine) in 30 ml of THF was added 10 ml of PhCN. The solution was stirred for 22 h, with color changed from yellow to orange-yellow, and then the solution was filtered through Celite. The solvent of the filtrate was removed under vacuum, and the residue was washed with *n*-hexane to give the title compound. The bright-yellow crystals of the title compound for X-ray structure analysis were obtained by slow diffusion of diethyl ether into a CH_2Cl_2 solution of the title compound at 0°C for 3 d.

Refinement

H atoms were placed in idealized positions and constrained to ride on their parent atoms, with C—H = 0.95 and B—H = 1.00 Å and $U_{iso}(H) = 1.2U_{eq}(C, B)$.

Figures

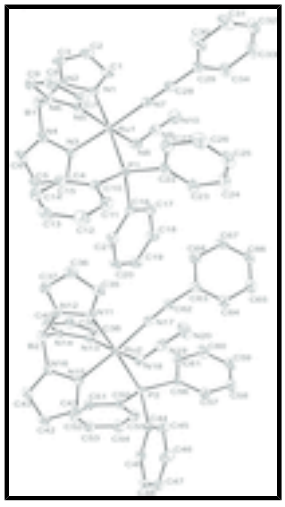

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level.

Received 21 May 2010; accepted 31 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.049; wR factor = 0.147; data-to-parameter ratio = 16.6.

The title compound, $[Li(C_5H_4N_3O_2)(H_2O)]_n$, is composed of centrosymmetric dinuclear units, in which the Li^I ions are bridged by two carboxylate O atoms donated by two ligands. The dinuclear unit is nearly planar [r.m.s. deviation = 0.0125 (2) Å]. The Li^I ion is coordinated by an *N*,*O*-chelating ligand, a bridging carboxylate O atom from another ligand and two bridging water O atoms in a distorted trigonal-bipyramidal geometry. The water O atoms bridge the dinuclear units into a polymeric molecular column along [010]. The columns are held together by O—H···O and N—H···N hydrogen bonds. An intramolecular N—H···O interaction also occurs.

Comment

Structural studies of divalent metal ion complexes with 3-aminopyrazine-2-carboxylate ligand have shown that the structures of Mg(II) and Ni(II) complexes consist of $ML_2(H_2O)_2$ monomers. In the Mg(II) comoplex, the ligand adopts a *cis* configuration (Ptasiewicz-Bąk & Leciejewicz, 1997), while in the Ni(II) complex, a *trans* configuration (Ptasiewicz-Bąk & Leciejewicz, 1999). Catenated polymeric molecular patterns have been reported in the structures of a Ca(II) complex (Leciejewicz *et al.*, 1997) and a Sr(II) complex (Leciejewicz *et al.*, 1998), in which metal ions are bridged by ligand carboxylate groups acting as bidentate. On the other hand, the structure of a Na(I) complex with the title ligand (Tayebee *et al.*,2008) is three-dimensional polymeric with Na(I) ions linked by an extended bridging system formed mainly by coordinated water O atoms.

The title compound is composed of centrosymmetric dinuclear units, in which each of the two Li^I ions is cheletated by a ligand *via* an N,O-bonding group. Its O atom acts as bidentate and bridges the other Li^I ion (Fig. 1). The dinuclear unit is nearly planar with r.m.s. of 0.0125 (2) Å. The Li^I ion is also coordinated by two water O atoms, which bridge the dinuclear units into molecular columns along two bridging pathways propagating in the *b*-axis direction (Fig. 2). The coordination geometry of the Li^I ion is trigonal bipyramidal, with the equatorial plane formed by O1, O3, $O3^{ii}$ and with N1 and $O1^{i}$ at the axial positions [symmetry codes: (i) 1-x, 1-y, 1-z; (ii) x, y-1, z]. The Li—O and Li—N bond distances (Table 1) and bond angles are typical for Li(I) complexes with carboxylate ligands (see, for example, Tombul *et al.*, 2008). The columns are linked by a network of hydrogen bonds, in which water O atoms are donors and the non-bonded carboxylate O atoms in adjacent columns act as acceptors. A weak hydrogen bond links an amino N atom with a hetero-ring N atom in the adjacent column. An intramolecular hydrogen bond which operates between the amino N3 atom and the non-bonding carboxylate O2 atom is also observed (Table 2).

Experimental

The title compound was synthesized by reacting 50 ml of boiling aqueous solutions, one containing 1 mmol of 3-aminopyrazine-2-carboxylic acid (Aldrich), the other containing 1 mmol of lithium hydroxide (Aldrich). The mixture was boiled under reflux for 3 h and after cooling to room temperature, filtered and left to crystallize. A few days later, colourless single crystals in the form of flat needles were found after evaporation to dryness. They were extracted, washed with cold ethanol and dried in air. A crystal used for X-ray data collection was cut to adopt the shape of a flat plate.

Refinement

Water H atoms were found from difference Fourier maps and their coordinates were refined with $U_{iso}(H) = 1.2U_{eq}(O)$. H atoms attached to C and N atoms were positioned geometrically and refined as riding, with C—H = 0.93 and N—H = 0.86 Å and $U_{iso}(H) = 1.2U_{eq}(C,N)$.

Figures

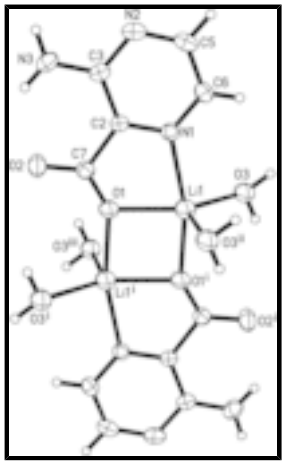

Fig. 1. The dinuclear unit of the title compound. Displacement ellipsoids are drawn at the 50% probability level. [Symmetry codes: (i) 1-x, 1-y, 1-z; (ii) x, -1+y, z; (iii) 1-x, 2-y, 1-z.]

Received 25 May 2010; accepted 31 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.006 Å; R factor = 0.038; wR factor = 0.069; data-to-parameter ratio = 20.7.

In the title compound, $[Co_2(NCSe)_4(C_4H_4N_2)_3(CH_3OH)_2]_n$, the Co^{II} ion is coordinated by three N-bonded pyrimidine ligands, two N-bonded selenocyanate anions and one O-bonded methanol molecule in an octahedral coordination mode. The asymmetric unit consists of one Co^{II} ion, one pyrimidine ligand, two selenocyanate anions and one methanol molecule in general positions as well as one pyrimidine ligand located around a twofold rotation axis. In the crystal structure, the pyrimidine ligands bridge $[Co(CNSe)_2(CH_3OH)]$ units into zigzag-like chains, which are further connected by pyrimidine ligands into layers parallel to (010).

Comment

Recently, we have shown that thermal decomposition reactions are an elegante route for the discovering and preparation of new ligand-deficient coordination polymers with defined magnetic properties (Wriedt & Näther, 2009a,b; Wriedt, Sellmer & Näther, 2009a,b). In our ongoing investigation in this field, we have reacted cobalt(II) nitrate, potassium selenocyanate and pyrimidine in methanol. The crystals obtained were identified by single crystal X-ray determination.

The title compound (Fig. 1) represents a two-dimensional layered coordination polymer, which is isotypic to its corresponding nickel(II) thiocyanate analogue reproted recently (Wriedt *et al.*, 2009). The crystal structure consists of µ-1,3-(*N*,*N*) pyrimidine bridged zigzag-like cobalt(II) selenocynate chains, which are further linked by µ-1,3-(*N*,*N*) pyrimidine ligands into layers (Fig. 2). Within each layer the Co^{II} ions are bridged by three pyrimidine ligands and are further terminally coordinated by two *N*-bonded selenocyanate anions and one *O*-bonded methanol molecule in an octahedral coordination mode (Fig. 1). The layers are stacked in the direction of the crystallographic *b*-axis (Fig. 3). The CoN_5O octahedron is markedly distorted with three long Co—$N_{pyrimidine}$ distances in the range of 2.184 (3) to 2.191 (3) Å, one long Co—O_{MeOH} distance of 2.142 (3) Å and two short Co—NCSe distances of 2.059 (4) and 2.064 (4) Å (Table 1). The angles arround the metal centers range between 86.37 (13) to 96.00 (13) and 173.71 (13) to 177.16 (14)°. The shortest intra- and interlayer Co···Co distances amount to 6.0723 (6) and 8.5630 (9) Å, respectively.

Experimental

$Co(NO_3)_2.6H_2O$ (72.8 mg, 0.25 mmol), KNCSe (72.0 mg, 0.5 mmol) and pyrimidine (20.0 mg, 0.25 mmol) obtained from Alfa Aesar were transfered in a closed snap-vial with methanol (3 ml). After several days at room temperature without stirring, light pink block-shaped single crystals of the title compound were obtained in a mixture with unknown phases.

Refinement

The O-bound H atom was located in a difference Fourier map and its bond length set to a ideal value and finally refined using a riding model. All other H atoms were positioned with idealized geometry and refined using a riding model, with C—H = 0.93 (CH) and 0.96 (CH_3) Å and with U_{iso}(H) = 1.2(1.5 for methyl)U_{eq}(C). The absolute structure was determined on the basis of 1579 Friedel pairs.

Key indicators: single-crystal X-ray study; T = 230 K; mean σ(C–C) = 0.008 Å; R factor = 0.073; wR factor = 0.206; data-to-parameter ratio = 15.5.

In the title compound, $\{[Mn(NCS)_2(C_{10}H_8N_2)_2]\cdot 2C_4H_{10}O\}_n$, the Mn^{II} ion is coordinated by four *N*-bonded 4,4′-bipyridine (bipy) ligands and two *N*-bonded thiocyanate anions in a distorted octahedral coordination geometry. The asymmetric unit consists of one Mn^{II} ion and two bipy ligands each located on a twofold rotation axis, as well as one thiocyanate anion and one diethyl ether molecule in general positions. In the crystal structure, the metal centers with terminally bonded thicyanate anions are bridged by the bipy ligands into layers parallel to (001). The diethyl ether solvent molecules occupy the voids of the structure.

M. Wriedt, I. Jess and C. Näther

Comment

Recently, we are interested in thermal decomposition reactions as an alternative tool for the discovering and preparation of new ligand-deficient coordination polymers with defined magnetic properties (Wriedt & Näther, 2009a,b; Wriedt *et al.*, 2009a,b). In our ongoing investigation on the synthesis, structures and properties of such compounds we have reacted manganese(II) chloride, potassium thiocyanate and 4,4-bipyridine (bipy). In this reaction single crystals of the title compound were grown.

The title compound (Fig. 1) represents a two-dimensional layered coordination polymer, in which the Mn^{II} atom is coordinated by four bipy ligands and two thiocyanate anions in an octahedral coordination mode. The crystal structure is isotypic to its cobalt(II) analogue (Lu *et al.*, 1997). In the crystal structure the metal atoms are bridged by the bipy ligands into layers with terminally N-bonded thicyanate anions. The layers are stacked perpendicular to the crystallographic *c* axis in order that the metal atoms in one layer sit above or below the squares formed by the metal atoms of the adjacent layers. By this arrangement voids are formed in which the diethyl ether molecules are located (Fig. 2). The MnN_6 octahedron is markedly distorted with four long Mn—N_{bipy} distances in the range of 2.277 (4) to 2.312 (4) Å and two short Mn—NCS distances of 2.181 (4) Å (Table 1). The angles arround the metal atoms range between 88.27 (8) to 91.73 (8) and 176.54 (16) to 180°. The pyridyl rings of the bipy ligands form dihedral angles of 51.2 (1) and 52.6 (1)°, respectively. The shortest intra- and interlayer Mn···Mn distances amount to 11.6391 (6) and 8.3198 (11) Å, respectively.

Experimental

$MnCl_2$ (117.0 mg, 0.93 mmol) and KNCS (180.8 mg, 1.86 mmol) obtained from Alfa Aesar were dissolved in a mixture of 10 ml water and 15 ml ethanol. This mixture was layered with a solution of 4,4-bipyridine (306.3 mg, 2 mmol) in 10 ml diethyl ether. After one day colourless block-shaped single crystals of the title compound were grown at the phase interface.

Refinement

The H atoms were located in a difference Fourier map but were positioned with idealized geometry and refined using a riding model, with C—H = 0.94 (aromatic), 0.98 (methylene) and 0.97 (methyl) Å and with U_{iso}(H) = 1.2(1.5 for methyl)U_{eq}(C).

Tetraaquabis(pyridine-κN)nickel(II) dinitrate

Mario Wriedt,* Inke Jess and Christian Näther

Institut für Anorganische Chemie, Christian-Albrechts-Universität Kiel, Max-Eyth-Strasse 2, 24098 Kiel, Germany
Correspondence e-mail: mwriedt@ac.uni-kiel.de

Received 25 May 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.005 Å; R factor = 0.049; wR factor = 0.129; data-to-parameter ratio = 21.1.

In the title compound, $[Ni(C_5H_5N)_2(H_2O)_4](NO_3)_2$, the Ni^{II} ion is coordinated by two *N*-bonded pyridine ligands and four water molecules in an octahedral coordination mode. The asymmetric unit consists of one Ni^{II} ion located on an inversion center, as well as one pyridine ligand, one nitrate anion and two water molecules in general positions. In the crystal structure, the discrete complex cations and nitrate anions are connected by O—H···O and C—H···O hydrogen bonds.

Tetraaquabis(pyridine-*κN*)nickel(II) dinitrate

M. Wriedt, I. Jess and C. Näther

Comment

Recently, we have shown that thermal decomposition reactions are an elegant route for the discovery and preparation of new ligand-deficient coordination polymers with defined magnetic properties (Wriedt & Näther, 2009a,b; Wriedt *et al.*, 2009a,b). In our ongoing investigation on the synthesis, structures and properties of such compounds based on paramagnetic transition metal pseudo-halides and N-donor ligands, we have reacted nickel(II) dinitrate hexahydrate, sodium dicyanamide and pyridine. In this reaction single crystals of the title compound were grown.

The title compound (Fig. 1) represents a discrete complex cation, in which the Ni^{II} atom, lying on an inversion center, is coordinated by two pyridine ligands and four water molecules in an octahedral coordination mode. The nitrate anions are not coordinated to the metal atoms (Fig. 2). The NiN_2O_4 octahedron is slightly distorted with Ni—$N_{pyridine}$ distances of 2.140 (2) Å and Ni—O_{water} distances of 2.113 (2) and 2.128 (2) Å (Table 1). The angles arround the metal atoms range between 85.71 (10) to 94.29 (10) and 180°. A similar coordination is found in a related structure (Halut-Desportes, 1981). The opposite pyridyl rings are coplanar due to symmetry. The shortest intermolecular Ni···Ni distance amounts to 7.3245 (4) Å.

Experimental

$Ni(NO_3)_2.6H_2O$ (72.7 mg, 0.25 mmol), sodium dicyanamide (44.5 mg, 0.5 mmol) and pyridine (0.5 ml) obtained from Alfa Aesar were reacted in a closed test-tube at 120°C for 3 d. On cooling light green block-shaped single crystals of the title compound were grown in a mixture with unknown phases.

Refinement

All H atoms were located in a difference Fourier map. H atoms bound to C atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 Å and with $U_{iso}(H) = 1.2U_{eq}(C)$. The water H atoms were disordered over three positions for each water molecule and were refined as riding, with O—H = 0.82 Å and $U_{iso}(H) = 1.5U_{eq}(O)$, using a split model with SOF = 0.6667 for each H atom.

Figures

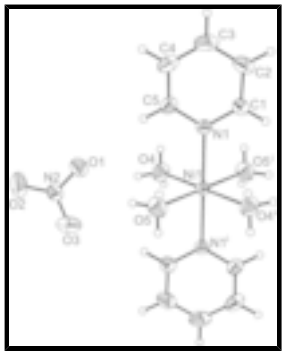

Fig. 1. The structure of the title compound with displacement ellipsoids drawn at the 30% probability level. Disordering of the H atoms is shown with full and open bonds. [Symmetry code: (i) -x+1, -y+1, -z+1.]

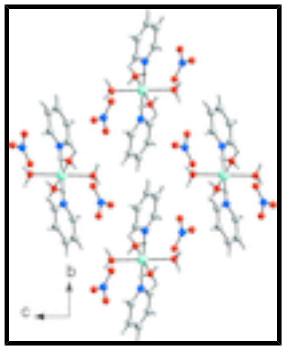

Fig. 2. Packing arrangement of the title compound with view along the *a* axis.

In the title compound, $[Cu(NO_3)_2(C_{14}H_{36}N_6)](NO_3)_2\cdot 4H_2O$, the Cu^{II} atom, lying on an inversion center, is six-coordinated in a distorted octahedral environment by four N atoms from a centrosymmetric 14-membered tetraazacyclotetradecane macrocyclic ligand and two O atoms from two nitrate anions. The supramolecular network is consolidated by extensive O—H···O and N—H···O hydrogen-bonding interactions.

Comment

In the past, much attention has been given to the copper complexes of macrocyclic *trans*-5(*R*),7(*R*),12(*R*), 14(*R*)-tetramethyl-6, 13-dinitro-1,4,8,11-tetraazacyclotetradecane and related ligands (Bernhardt, 1999; Bernhardt & Sharpe, 1998). Recently, we have synthesized a Cu(II) complex based on 5,7,12,14-tetramethyl-6,13- diamino-1,4,8,11-tetraazacyclotetradecane and its structure is reported here.

The asymmetric unit of the title compound (Fig. 1) contains one Cu^{II} ion lying on an inversion center, one half of a 14-membered tetraazacyclotetradecane macrocyclic ligand, one coordinated nitrate anion, one uncoordinated nitrate anion and two solvent water molecules. The Cu^{II} ion has a slightly distorted octahedral coordination geometry, with two O atoms from two nitrate anions in the axial positions. The equatorial positions are occupied by four N atoms from the centrosymmetric 14-membered tetraazacyclotetradecane macrocyclic ligand [Cu1—N1 2.025 (2) and Cu1—N2 2.020 (2) Å]. The two uncoordinated nitrate anions are located above and below the 14-membered tetraazacyclotetradecane macrocycle and linked to the macrocycle *via* N—H···O hydrogen bonds (Table 1).

Experimental

An aqueous solution of 5,7,12,14-tetramethyl-6,13-diamino-1,4,8,11-tetraazacyclotetradecane (0.27 g, 1.0 mmol), $Cu(NO_3)_2$ (0.10 g, 0.5 mmol) and Na_2CO_3 (0.05 g, 0.5 mmol) was heated to reflux for 24 h. The reaction mixture was cooled to room temperature and red crystals of the title compound were obtained by slow evaporation of the solvent at room temperature.

Refinement

H atoms bound to C and N atoms were placed at calculated positions and were treated as riding on the parent atoms, with C—H = 1.00 (CH), 0.99 (CH_2) and 0.98 (CH_3) Å and N—H = 0.93 (NH) and 0.91 (NH_3) Å and with U_{iso}(H) = 1.2–1.5 U_{eq}(C, N). H atoms attached to water molecules were located in a difference Fourier map and refined with U_{iso}(H) = 1.2U_{eq}(O). The highest residual electron density was found 0.91 Å from O3 the deepest hole 0.52 Å from H2WA.

Figures

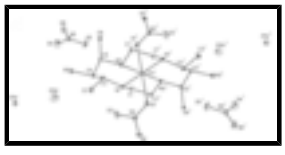

Fig. 1. The molecular structure of the title compound. Displacement ellipsoids are shown at the 30% probability level. H atoms have been omitted for clarity. [Symmetry code: (i) 2-x, -y, 1-z.]

Tricyclohexyl{2-[(3,5-di-*tert*-butyl-4-hydroxybenzyl)sulfanyl]acetato-κO}tin(IV)

See Mun Lee, Hapipah Mohd Ali and Kong Mun Lo*

Department of Chemistry, University of Malaya, 50603 Kuala Lumpur, Malaysia
Correspondence e-mail: kmlo@um.edu.my

Received 27 May 2010; accepted 8 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.007 Å; R factor = 0.050; wR factor = 0.117; data-to-parameter ratio = 22.0.

The title compound, $[Sn(C_6H_{11})_3(C_{17}H_{25}O_3S)]$, exists as a monomeric molecule with the Sn^{IV} atom in a distorted tetrahedral C_3O coordination geometry. The presence of two bulky *tert*-butyl groups on the carboxylate prevents any hydrogen-bonding interactions involving the hydroxy group.

Related literature

For tricyclohexyltin carboxylates, see: Tiekink (1991). For a triphenyltin analogue of the title compound, see: Lee *et al.* (2009). For other related structures, see: Alcock & Timms (1968); Keng *et al.* (2010); Ng & Kumar Das (1997); Thong *et al.* (2009); Zhang *et al.* (2007). For the preparation of the ligand, see: Yehye *et al.* (2009).

Tricyclohexyl{2-[(3,5-di-*tert*-butyl-4-hydroxybenzyl)sulfanyl]acetato-*κO*}tin(IV)

S. M. Lee, H. Mohd Ali and K. M. Lo

Comment

Triorganotin carboxylates are either monomeric or polymeric, depending primarily on the types of organic groups bonded to the tin atom. Triphenyltin carboxylates generally adopt a five-coordinated tin geometry with carboxylate bridges linking adjacent molecules into a polymeric chain, whereas tricyclohexyltin carboxylates have discrete four-coordinated tin structures (Tiekink, 1991).

The title compound is another example of a four-coordinated tricyclohexyltin carboxylate, in which the Sn^{IV} atom is in a distorted tetrahedral geometry. The close proximity of the carboxylate O3 towards the Sn atom [Sn1···O3 = 2.897 (3) Å] contributes to the distortion of the geometry (Alcock & Timms, 1968).

Experimental

The title compound was prepared by refluxing 2-(3,5-di-*tert*-4-hydroxybenzyl)sulfanylacetic acid (0.39 g, 1 mmol) with tricyclohexyltin hydroxide (0.39 g, 1 mmol) in absolute ethanol for 2 h. Colourless crystals were obtained by slow evaporation of the solution at room temperature.

Refinement

H atoms were placed at calculated positions and treated as riding on their parent atoms, with C—H = 0.93 (aromatic), 0.98 (CH), 0.97 (CH_2) and 0.96 (CH_3) Å and O—H = 0.82 Å and with U_{iso}(H) = 1.2(1.5 for methyl and hydroxyl)U_{eq}(C,O).

Figures

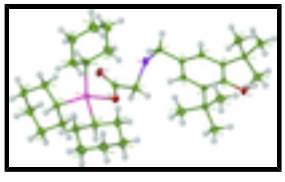

Fig. 1. The molecular structure of the title compound, showing the 30% probability displacement ellipsoids.

Tricyclohexyl{2-[(3,5-di-*tert*-butyl-4-hydroxybenzyl)sulfanyl]acetato- κ*O*}tin(IV)

Crystal data

$[Sn(C_6H_{11})_3(C_{17}H_{25}O_3S)]$	$F(000)$ = 1432
M_r = 677.56	D_x = 1.276 Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, λ = 0.71073 Å
Hall symbol: -P 2ybc	Cell parameters from 4134 reflections
a = 15.5048 (3) Å	θ = 2.2–20.5°

b = 11.4261 (3) Å	μ = 0.81 mm^{-1}
c = 19.9794 (4) Å	T = 296 K
β = 94.603 (2)°	Prism, colourless
V = 3528.12 (14) Å^3	0.23 × 0.16 × 0.12 mm
Z = 4	

Data collection

Bruker APEXII CCD diffractometer	8086 independent reflections
Radiation source: fine-focus sealed tube	4695 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.068
φ and ω scans	θ_{max} = 27.5°, θ_{min} = 1.3°
Absorption correction: multi-scan (*SADABS*; Bruker, 2001)	h = −20→20
T_{min} = 0.835, T_{max} = 0.909	k = −14→14
32619 measured reflections	l = −25→25

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.050	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.117	H-atom parameters constrained
S = 1.00	$w = 1/[\sigma^2(F_o^2) + (0.0472P)^2 + 1.0822P]$ where $P = (F_o^2 + 2F_c^2)/3$
8086 reflections	$(\Delta/\sigma)_{max}$ = 0.002
368 parameters	$\Delta\rho_{max}$ = 0.65 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.37 e Å^{-3}

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

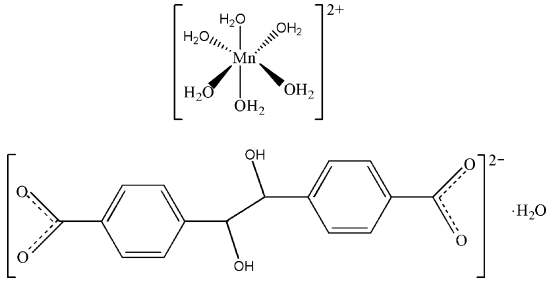
Received 1 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.006 Å; R factor = 0.057; wR factor = 0.140; data-to-parameter ratio = 13.4.

In the title compound, $[Mn(H_2O)_6](C_{16}H_{12}O_6)\cdot H_2O$, the $[Mn(H_2O)_6]^{2+}$ complex cation lies on a mirror plane, the 4,4′-(1,2-dihydroxyethane-1,2-diyl)dibenzoate anion is located on an inversion center and the solvent water molecule also lies on a mirror plane. Extensive O—H···O hydrogen-bonding interactions between the cations, anions and water molecules stabilize the three-dimensional network.

Related literature

For the intriguing architectures and potential applications of polymeric coordination networks, see: Carlucci *et al.* (2003); Rosi *et al.* (2003).



Experimental

Crystal data

$[Mn(H_2O)_6](C_{16}H_{12}O_6)\cdot H_2O$
M_r = 481.31
Monoclinic, $P2_1/m$
a = 6.0803 (6) Å
b = 20.643 (2) Å
c = 8.6610 (9) Å
β = 104.420 (1)°
V = 1052.84 (19) Å^3
Z = 2
Mo $K\alpha$ radiation
μ = 0.69 mm^{-1}
T = 298 K
0.42 × 0.21 × 0.18 mm

Data collection

Bruker SMART 1000 CCD diffractometer
Absorption correction: multi-scan (*SADABS*; Bruker, 2001)
T_{min} = 0.760, T_{max} = 0.886
5275 measured reflections
1899 independent reflections
1647 reflections with $I > 2\sigma(I)$
R_{int} = 0.024

Refinement

$R[F^2 > 2\sigma(F^2)]$ = 0.057
$wR(F^2)$ = 0.140
S = 1.23
1899 reflections
142 parameters
H-atom parameters constrained

Hexaaquamanganese(II) 4,4'-(1,2-dihydroxyethane-1,2-diyl)dibenzoate monohydrate

C.-J. Hao and Y.-L. Cao

Comment

Current interest in polymeric coordination networks is rapidly expanding for their intriguing architectures (Carlucci *et al.*, 2003) and potential applications (Rosi *et al.*, 2003). We have reacted 1,2-bis(4-carboxyphenyl)-1,2-ethanediol with $MnCl_2$ under hydrothermal conditions to obtain the title compound and its structure is reported here.

As illustrated in Fig. 1, the title compound contains one $[Mn(H_2O)_6]^{2+}$ complex cation lying on a mirror plan, one 1,2-dihydroxyethane-1,2-bis(4-benzenecarboxylate) anion located on an inversion center and one solvent water molecule lying on a mirror plan. The carboxylate group lies in the plane of the benzene ring as indicated by the O1—C1—C2—C3 and O2—C1—C2—C7 torsion angles of -3.0 (6) and -1.2 (6)°. The benzene ring is nearly planar with maximum deviations from the mean plane being -0.003 (6) Å for C6. The cation, anion and solvent water molecule interact via O—H···O hydrogen bonds, consolidating the three-dimensional network (Fig. 2, Table 1).

Experimental

A mixture of $MnCl_2$ (0.1 mmol, 0.013 g), 1,2-bis(4-carboxyphenyl)-1,2-ethanediol (0.1 mmol, 0.03 g) and 10 ml of H_2O was sealed in a 20 ml Telflon-lined stainless steel vessel and heated at 303 K for 2 d. Colorless crystals were obtained when the solution was cooled to room temperature slowly.

Refinement

H atoms bound to C atoms were placed at calculated positions and were treated as riding on the parent atoms, with C—H = 0.93 (aromatic) and 0.98 (CH) Å and with U_{iso}(H) = 1.2U_{eq}(C). H atoms of hydroxyl group and water molecules were located in a difference Fourier map and refined as riding, with O—H = 0.85 Å and U_{iso}(H) = 1.2(1.5 for hydroxyl)U_{eq}(O).

Figures

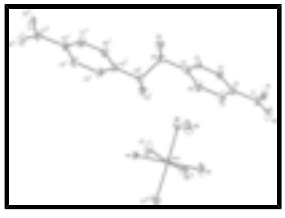

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are shown at the 30% probability level. H atoms and water molecule are omitted for clarity. [Symmetry codes: (i) 1-x, 1-y, 1-z; (ii) x, 3/2-y, z.]

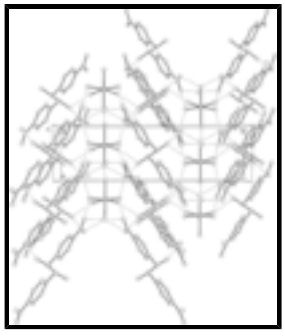

Fig. 2. View of the three-dimensional network constructed by O—H···O hydrogen bonds (dashed lines). H atoms are omitted for clarity.

Hexakis(dimethyl sulfoxide-κO)-thallium(III) trinitrate

Mohammad Ghadermazi[a]* and Faranak Manteghi[b]

[a]Department of Chemistry, Faculty of Science, University of Kurdistan, Sanandaj, Iran, and [b]Department of Chemistry, Iran University of Science and Technology, Tehran, Iran
Correspondence e-mail: mghadermazi@yahoo.com

Received 8 June 2010; accepted 13 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(S–C) = 0.004 Å; disorder in solvent or counterion; R factor = 0.022; wR factor = 0.058; data-to-parameter ratio = 25.1.

The title compound, $[Tl(C_2H_6OS)_6](NO_3)_3$, consists of six dimethyl sulfoxide (DMSO) molecules coordinated to a Tl^{III} atom, which lies on a $\overline{3}$ axis, and three nitrate anions (3. symmetry) to neutralize the charge. The coordination polyhedron around the Tl^{III} atom is octahedral, defined by six O atoms of the DMSO molecules. In the crystal structure, C—H···O hydrogen bonds are observed. One of the nitrate groups exhibits half-occupation.

Hexakis(dimethyl sulfoxide-*κO*)thallium(III) trinitrate

M. Ghadermazi and F. Manteghi

Comment

There are some reports on coordination of dimethyl sulfoxide (DMSO) as a neutral ligand to Tl(III), such as a triiodo complex [$TlI_3(DMSO)_2$] (Ma *et al.*, 2002) and [$Tl(dm4bt)_2(NO_3)(DMSO)$] (dm4bt = 2,2'-dimethyl-4,4'-bithiazole) (Notash *et al.*, 2008). Thallium(III) can be classified as a medium-soft metal ion in contrast to the other trivalent ions of group 13, aluminium(III), gallium(III) and indium(III), which are regarded as hard from their coordination properties (Tóth & Gyõri, 1994). The title compound has a coordination number of six around the metal (Figs. 1 and 2). However, the coordination numbers 4 to 9 are observed in different thallium(III) complexes (Aghabozorg, Ramezanipour *et al.*, 2006). Compared with [$Tl(dm4bt)_2(NO_3)(DMSO)$] and [$TlI_3(DMSO)_2$] mentioned above, in which the bond lengths of Tl(III) to O atoms of DMSO are 2.644 (7) and 2.468 (6) Å, the title compound has shorter Tl—O bonds [2.223 (2)–2.224 (2) Å]. This can be attributed to the less hindrance around the Tl centre. Also, compared with [$Tl_2(pydcH)_3(pydc)(H_2O)_2$] ($pydcH_2$ = pyridine-2,6-dicarboxylic acid) (Aghabozorg, Ramezanipour *et al.*, 2006) and ($pipzH_2$)[$Tl_2(pydc)_2Cl_4(H_2O)_2$].$4H_2O$ (pipz = piperazine) (Aghabozorg, Ghadermazi *et al.*, 2006), whose Tl—O bond lengths vary in the range of 2.680 (4)–3.122 (4) and 2.436 (5)–2.508 (5) Å, respectively, again the Tl—O bond lengths in the title compound are obviously shorter. As shown in Table 1, only C—H···O hydrogen bonds can be seen in the lattice. The shortest C—H···O bond is C2—H2B···O2 with the best angle.

Experimental

To a DMSO solution of $Tl(NO_3)_3.3H_2O$ (1 mmol, 443 mg) was added piperazinediium pyridine-2,6-dicarboxylate (3 mmol, 759 mg) prepared as literature (Aghabozorg, Ghadermazi *et al.*, 2006). The total volume of solution was 40 ml. The colourless crystals suitable for crystallography were obtained after six months.

Refinement

H atoms on C atoms were positioned geometrically and refined as riding atoms, with C—H = 0.96 Å and U_{iso}(H) = 1.5U_{eq}(C). There is a high positive residual density of 1.97 e $Å^{-3}$ near the Tl1 atom (distance 0.76 Å) due to considerable absorption effects which could not be completely corrected.

Figures

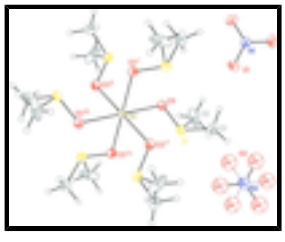

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are shown at the 50% probability level. [Symmetry codes: (i) 1/3+x-y, -1/3+x, 2/3-z; (ii) 1-y, x-y, z; (iii) 4/3-x, 2/3-y, 2/3-z; (iv) 1-x+y, 1-x, z; (v) 1/3+y, 2/3-x+y, 2/3-z.]

Received 9 June 2010; accepted 16 June 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.006 Å; R factor = 0.051; wR factor = 0.153; data-to-parameter ratio = 13.1.

In the title mononuclear iron(III) complex, $[Fe(C_{15}H_{13}N_2O_3)_2]Cl\cdot H_2O$, the Fe^{III} atom has a distorted octahedral geometry and is six-coordinated by four O atoms and two N atoms from two ligands. In the crystal structure, the complex cations, Cl^- anions and water molecules are connected into a chain along [100] through N—H···O, O—H···Cl and N—H···Cl hydrogen bonds. Two adjacent chains are linked by O—H···O hydrogen bonds.

Comment

Studies of acylhydrazone Schiff base and the dependence of their chelation mode with transition metal ions have been of significant interest. On one hand, their metal compounds have been reported to act as enzyme inhibitors (Dilworth, 1976) and are useful due to their pharmacological applications (Merchant & Clothia, 1970). On the other hand, it seems to be a good candidate for catalytic oxidation studies because of their stability to resist oxidation (Pickart *et al.*, 1983). These findings have triggered the exploration of new molecular clusters based on acylhydrazone Schiff base. During the last several years, the crystal structures of metal compounds with 3-methoxysalicylaldehyde benzoylhydrazide have been attracted tremendous interest (Gao *et al.*, 1998; Monfared *et al.*, 2007; Yu *et al.*, 2010). As a continuation of our effort in this system, the preparation and crystal structure of the title Schiff base iron(III) compound are reported here.

The molecular structure of the title compound is illustrated in Fig. 1, which consists of one mononuclear $[Fe(C_{15}H_{13}N_2O_3)_2]^+$ cation, one Cl^- anion and one water molecule. The Fe^{III} atom has a distorted octahedral geometry and is six-coordinated by four O atoms and two N atoms from two ligands (Table 1). In one ligand, the strained angle of O1—Fe1—N2 [74.54 (11)°] correlates with the bite angle for the five-membered chelate ring Fe1—O1—C7—N1—N2, and the loose angle of O2—Fe1—N2 [84.74 (11)°] correlates with the six-membered ring Fe1—N2—C8—C9—C10—O2. The axial angle N2—Fe1—N4 [159.46 (12)°] deviates significantly from the ideal 180°. Similar case occurrs for another ligand. In the crystal structure, the complex cations, Cl^- anions and water molecules are connected into a chain through N—H···O, O—H···Cl and N—H···Cl hydrogen bonds. Two adjacent chains are linked by O—H···O hydrogen bonds. (Fig. 2 and Table 2).

Experimental

The 3-methoxysalicylaldehyde benzoylhydrazide ligand (H_2L) was prepared in a similar manner according to the reported procedures (Pouralimardan *et al.*, 2007; Sacconi, 1954). The title compound was synthesized by adding $FeCl_3.6H_2O$ (27.0 mg, 0.1 mmol) to a solution of H_2L (27.3 mg, 0.10 mmol) in methanol (15 ml). The resulting mixture was stirred for 3 h at room temperature to afford a dark brown solution and then filtered. The filtrate was allowed to stand at room temperature for about three weeks and black crystals were produced at the bottom of the vessel on slow evaporation of methanol.

Refinement

All H atoms were placed in calculated positions and refined using a riding model, with C—H = 0.93 (aromatic), 0.96 (methyl) Å and N—H = 0.86 Å and with U_{iso}(H) = 1.2(1.5 for methyl)U_{eq}(C, N). Water H atoms were located in a difference Fourier map and refined as riding, with O—H = 0.85 Å and U_{iso}(H) = 1.2U_{eq}(O).

Figures

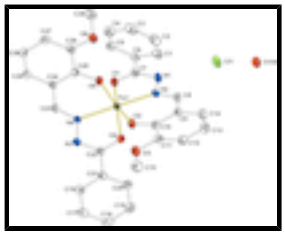

Fig. 1. Molecular structure of the title compound. H atoms are omitted for clarity. Displacement ellipsoids are drawn at the 30% probability level.

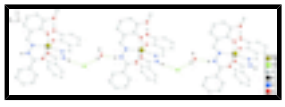

Fig. 2. One-dimensional chain structure in the title compound. Hydrogen bonds are shown as green dashed lines.

Bis{2-[(2-benzoylhydrazin-1-ylidene)methyl]-6-methoxyphenolato}iron(III) chloride monohydrate

Crystal data

$[Fe(C_{15}H_{13}N_2O_3)_2]Cl·H_2O$	$F(000) = 1340$
$M_r = 647.86$	$D_x = 1.479$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 4767 reflections
$a = 12.7778$ (10) Å	$\theta = 4.8–51.7°$
$b = 22.7113$ (18) Å	$\mu = 0.67$ mm^{-1}
$c = 10.0604$ (7) Å	$T = 296$ K
$\beta = 94.542$ (1)°	Block, black
$V = 2910.4$ (4) Å^3	0.24 × 0.18 × 0.15 mm
$Z = 4$	

Data collection

Bruker SMART APEX CCD diffractometer	5098 independent reflections
Radiation source: fine-focus sealed tube	3508 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.052$
φ and ω scans	$\theta_{max} = 25.0°$, $\theta_{min} = 1.8°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -15\rightarrow15$
$T_{min} = 0.857$, $T_{max} = 0.907$	$k = -27\rightarrow23$
14540 measured reflections	$l = -11\rightarrow10$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.153$	H-atom parameters constrained

$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0933P)^2 + 0.1872P]$ where $P = (F_o^2 + 2F_c^2)/3$
5098 reflections	$(\Delta/\sigma)_{max} < 0.001$
390 parameters	$\Delta\rho_{max} = 0.95$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.47$ e Å^{-3}

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.042; wR factor = 0.102; data-to-parameter ratio = 19.3.

The asymmetric unit of the title complex, $[Mn_2(C_8H_7O_2)_4(C_{10}H_{14}N_2O)_2(H_2O)]_n$, contains two crystallographically independent units. In each one, the Mn^{II} ions are bridged by two 4-methylbenzoate (PMB) ligands and one water molecule. In the crystal structure, each Mn^{II} ion is coordinated by three PMB ligands, one water molecule and two symmetry-related *N*,*N*-diethylnicotinamide (DENA) ligands. Symmetry-related Mn^{II} ions are bridged by the N and O atoms of symmetry-related DENA ligands, forming polymeric chains parallel to [100]. The coordination environmnts for the Mn^{II} ions are slightly distorted octahedral. Intramolecular O—H···O hydrogen bonds link bridging water molecules to the carboxylate O atoms of a neighboring polymeric chain. In the crystal structure, π–π contacts between benzene rings [centroid–centroid distance = 3.562 (1) Å] and weak C—H···π interactions are also observed.

Comment

Transition metal complexes with biochemicaly relevant ligands show interesting physical and/or chemical properties, through which they may find applications in biological systems (Antolini *et al.*, 1982). Some benzoic acid derivatives, such as 4-aminobenzoic acid, have been extensively reported in coordination chemistry as bifunctional organic ligands due to the varieties of their coordination modes (Chen & Chen, 2002; Amiraslanov *et al.*, 1979; Hauptmann *et al.*, 2000). Nicotinamide (NA) is one form of niacin. A deficiency of this vitamin leads to loss of copper from the body, known as pellagra disease. Victims of pellagra show unusually high serum and urinary copper levels (Krishnamachari, 1974). The nicotinic acid derivative *N*,*N*-Diethylnicotinamide (DENA) is an important respiratory stimulant (Bigoli *et al.*, 1972).

The structure-function-coordination relationships of arylcarboxylate ions in Mn^{II} complexes of benzoic acid derivatives may also change depending on the nature and position of the substituted groups on the benzene ring, the nature of the additional ligand molecule or solvent, and the pH and temperature of synthesis (Shnulin *et al.*, 1981; Antsyshkina *et al.*, 1980; Adiwidjaja *et al.*, 1978). When pyridine and its derivatives are used instead of water molecules, the structure is completely different (Catterick *et al.*, 1974). The title complex, (I), was synthesized and its crystal structure is reported herein.

The asymmetric unit of the title complex, (I), contains two crystallographically independent moieties. In each moiety, Mn^{II} ions are bridged by two 4-methylbenzoate (PMB) ligands and one water molecule. In the crystal structure of the title complex, each Mn^{II} ion is coordinated by three PMB ligands, one water molecule and two symmetry related DENA ligands. Symmetry related Mn^{II} ions are bridged by the N and O atoms of symmetry related DENA ligands forming polymeric chains (Fig. 1).

Coordination spheres around Mn1 and Mn2 (corresponding to Mn3 and Mn4 in the second moiety) are different. In the octahedron around Mn1 the nitrogen atom of a DENA ligand is in *trans*-position with respect to the bridging water ligand. The monodentate 4-methylbenzoate oxygen and another oxygen from the DENA ligand are *trans* to the bridging 4-methylbenzoate ligands. Around Mn2 bridging 4-methylbenzoate ligands are *trans* with respect to a DENA nitrogen atom and an oxygen from a another monodentate 4-methylbenzoate ligand.

Atoms (O2, O3, O8, O10), (O1, O4, O6, N1''), (O13, O15, O17, O21) and (O12, O14, O19, N6') in the equatorial planes around Mn1, Mn2, Mn3 and Mn4, respectively, form slightly distorted square-planar arrangements, while the slightly distorted octahedral coordinations are completed by the atoms (O9, N2), (O9, O11''), (O22, N5'') and (O20, O22) in the axial positions (Table 1 and Fig. 1) [symmetry codes:(') 1 + x, y, z, ('') x - 1, y, z]. The structures of similar Mn^{II} and Zn(II) polymeric complexes $\{[Mn(C_{11}H_{14}NO_2)_2(H_2O)_3].2H_2O\}_n$ (Hökelek *et al.*, 2009a) and $[Zn(C_8H_5O_3)_2(C_6H_6N_2O)]_n$ (Hökelek *et al.*, 2009b) have also been determined.

The average Mn—O bond length (Table 1) is 2.1699 (14) Å and Mn atoms are displaced out of the least-squares planes of the carboxylate groups: Mn1 atom for (O1/C1/O2), (O3/C9/O4) and (O7/C25/O8) by 0.3349 (3), 0.2642 (4) and -0.5844 (4) Å, respectively, Mn2 atom for (O1/C1/O2), (O3/C9/O4) and (O5/C17/O6) by -0.0412 (3), 0.4940 (4) and 0.1143 (3) Å, respectively, Mn3 atom for (O12/C53/O13), (O14/C61/O15) and (O16/C69/O17) by 0.3463 (4), -0.2062 (3) and 0.2611 (4) Å, respectively, and Mn4 atom for (O12/C53/O13), (O14/C61/O15) and (O18/C77/O19) by 0.6423 (4), 0.0305 (3) and 0.3320 (3) Å, respectively. The dihedral angles between the planar carboxylate groups and the adjacent benzene rings A (C2—C7), B (C10—C15), C (C18—C23), D (C26—C31), G (C54—C59), H (C62—C67), I (C70—C75) and J (C78—C83) are 13.35 (16), 10.82 (12), 7.48 (15), 7.33 (9), 11.86 (10), 11.42 (10), 6.68 (18) and 1.79 (11) °, respectively, while those between rings A, B, C, D, E (N1/C33—C37), F (N2/C38—C42) and G, H, I, J, K (N5/C86—C89), L (N6/C90—C94) are A/B = 64.86 (7), A/C = 35.09 (7), A/D = 63.93 (9), B/C = 83.44 (7), B/D = 22.10 (8), C/D = 87.56 (8), E/F = 33.93 (6) ° and G/H = 60.41 (6), G/I = 14.54 (8), G/J = 62.80 (7), H/I = 68.14 (7), H/J = 23.40 (7), I/J = 75.02 (8), K/L = 43.80 (8) °.

Intramolecular O—H···O hydrogen bonds (Table 1) link bridging water molecules to carboxylate O atoms of neighboring polymeric chains. In the crystal structure, π–π contacts between the benzene rings, Cg3—$Cg3^{i}$ with a centroid-centroid distance of 3.562 (1) Å [symmetry code: (i) -x, 1 - y, -z, where Cg3 is the centroid of the ring C (C18—C23)] and four weak C—H···π interactions are also observed (Table 1).

Experimental

The title compound was prepared by the reaction of $MnSO_4.H_2O$ (0.84 g, 5 mmol) in H_2O (10 ml) and DENA (1.78 g, 10 mmol) in H_2O (10 ml) with sodium 4-methylbenzoate (1.58 g, 10 mmol) in H_2O (150 ml). The mixture was filtered and set aside to crystallize at ambient temperature for one week, giving colorless single crystals (yield 2.05 g, 40.02 %).

Refinement

Atoms H9A, H9B, H22A and H22B (for water molecules) were located in difference Fourier maps and refined isotropically, with restrain of O9—H9B = 0.937 (18) Å. [U_{iso}(H) = 0.046 (8), 0.069 (11), 0.035 (7) and 0.081 (12) $Å^2$ for H9A, H9B, H22A and H22B, respectively]. The remaining H atoms were positioned geometrically with C—H = 0.93, 0.97 and 0.96 Å for aromatic, methylene and methyl H atoms, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = xU_{eq}(C), where x = 1.5 for methyl H and x = 1.2 for all other H atoms.

Figures

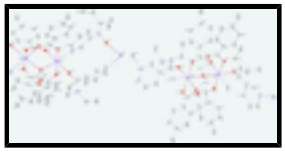

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme. Displacement ellipsoids are drawn at the 35% probability level. Hydrogen bonds are shown as dashed lines. Hydrogen atoms not involved in hydrogen bonding are omitted for clarity. Primed atoms are generated by the symmetry operators:(') 1 + x, y, z, (") x - 1, y, z.

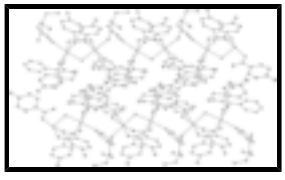

Fig. 2. Part of the polymeric chains of the title compound.

catena-Poly[[(4-methylbenzoato-κ_O_)manganese(II)]-μ-aqua- bis(μ-4-methylbenzoato-κ^2_O_:_O_^{1})[(4-methylbenzoato- κ_O_)manganese(II)]-bis(μ-_N_,_N_-diethylnicotinamide)- κ^2_N_^{3}:_O_;_O_:_N_^{3}]

Crystal data

$[Mn_2(C_8H_7O_2)_4(C_{10}H_{14}N_2O)_2(H_2O)]$	$Z = 4$
$M_r = 1024.90$	$F(000) = 2144$
Triclinic, $P\overline{1}$	$D_x = 1.375$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 10.5228$ (2) Å	Cell parameters from 9867 reflections
$b = 19.1361$ (3) Å	$\theta = 2.3$–$28.0°$
$c = 26.6008$ (4) Å	$\mu = 0.57$ mm^{-1}
$\alpha = 70.537$ (2)°	$T = 100$ K
$\beta = 78.836$ (3)°	Block, colorless
$\gamma = 88.485$ (3)°	0.35 × 0.24 × 0.15 mm
$V = 4950.63$ (17) Å^3	

Data collection

Bruker Kappa APEXII CCD area-detector diffractometer	24563 independent reflections
Radiation source: fine-focus sealed tube	17121 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.049$
φ and ω scans	$\theta_{max} = 28.4°$, $\theta_{min} = 1.7°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2005)	$h = -14 \rightarrow 14$
$T_{min} = 0.848$, $T_{max} = 0.917$	$k = -25 \rightarrow 25$
87669 measured reflections	$l = -35 \rightarrow 35$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.042$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.102$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0376P)^2 + 2.5004P]$ where $P = (F_o^2 + 2F_c^2)/3$
24563 reflections	$(\Delta/\sigma)_{max} = 0.001$
1275 parameters	$\Delta\rho_{max} = 0.40$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.51$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 12 May 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 295 K; mean σ(C–C) = 0.005 Å; R factor = 0.037; wR factor = 0.117; data-to-parameter ratio = 9.6.

The title compound, $C_{13}H_8FNO_2$, was synthesized from 3,4-difluorobenzonitrile and hydroquinone. The dihedral angle between the two aromatic rings is 70.9 (2)°. In the crystal structure, molecules are linked by O—H···N hydrogen bonds, forming zigzag chains.

3-Fluoro-4-(4-hydroxyphenoxy)benzonitrile

M. Zheng, J. Wang, J. Zhang and S. Luo

Comment

Hydroquinone derivatives are important intermediates of herbicide synthesis and have therefore received growing attention recently (Liu, 2002; Bao *et al.*, 2007). Several hydroquinone derivatives were synthesized and investigated by X-ray diffraction in our laboratory. 4-(4-Cyano-2-fluoro-phenoxy)-phenol was obtained reacting hydroquinone and 3,4-difluorobenzonitrile and it's molecular structure is shown in Fig.1.

As it is expected substituents at both aromatic rings are coplanar with repect to the aromatic planes. The dihedral angle between the two planes is 70.66°. The molecule is bent with a C6—O1—C7 angle of 118.0 (2)°. The crystal structure is determined by intermolecular O—H···N interactions. The resulting supramolecular chains of the title compound showing H-bridge interactions is shown in Fig.2.

Experimental

A DMSO (10 ml) solution of hydroquinone (0.0012 mol) and NaOH (0.0024 mol) was stirred at room temperature for 5 h. Then the mixture was heated to 80°C and 3,4-difluorobenzonitrile (0.001 mol) was added dropwise and stirred for 10 h. Then the mixture was washed with water (30 ml) and extracted with ethyl acetate (three times). The organic solvent was removed under reduced pressure and the resulting crude product was purified by silica gel chromatography (pentane: ethyl acetate mixtures, yield 86%). Single crystals were obtained by slow evaporation of ethyl acetate at room temperature.

Refinement

In the absence of significant anomalous dispersion effects, Friedel pairs were averaged. H atoms were placed in calculated positions with C—H = 0.98 Å (sp), C—H = 0.97 Å (sp^2), C—H = 0.93 Å (aromatic). All H atoms were included in the final cycles of refinement using a riding model, with $U_{iso}(H)=1.2U_{eq}$ of the respective carrier atoms.

Figures

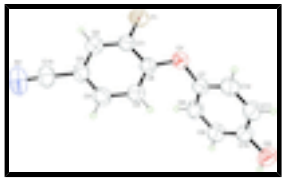

Fig. 1. Molecular structure of title compound, with the atomic labeling scheme. Displacement ellipsoids are drawn at the 50% probability level.

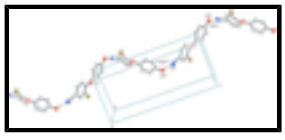

Fig. 2. A partial packing diagram of title compound. Hydrogen bonds are shown as dashed lines. [Symmetry code: (i) -x+1/2, -y+2, z+1/2].

3-Fluoro-4-(4-hydroxyphenoxy)benzonitrile

Crystal data

$C_{13}H_8FNO_2$	$F(000) = 472$

Data collection

Rigaku R-AXIS RAPID diffractometer	1498 independent reflections
Radiation source: rolling anode	928 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.032$
Detector resolution: 10.00 pixels mm^{-1}	$\theta_{max} = 27.4°$, $\theta_{min} = 3.1°$
ω scans	$h = -8\rightarrow8$
Absorption correction: multi-scan (*ABSCOR*; Higashi, 1995)	$k = -11\rightarrow11$
$T_{min} = 0.959$, $T_{max} = 0.976$	$l = -26\rightarrow26$
10999 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.117$	$w = 1/[\sigma^2(F_o^2) + (0.0487P)^2 + 0.2503P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.01$	$(\Delta/\sigma)_{max} < 0.001$
1498 reflections	$\Delta\rho_{max} = 0.17$ e Å^{-3}
156 parameters	$\Delta\rho_{min} = -0.15$ e Å^{-3}
0 restraints	Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.031 (5)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4-Fluoroanilinium tetrachloridoferrate(III) 18-crown-6 clathrate

Jia-Zhen Ge* and Min-Min Zhao

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 211189, People's Republic of China
Correspondence e-mail: gjz@seu.edu.cn

Received 15 May 2010; accepted 27 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.010 Å; R factor = 0.078; wR factor = 0.271; data-to-parameter ratio = 21.5.

The reaction of 4-fluoroaniline hydrochloride, 18-crown-6 and ferric chloride in methanolic solution yields the title compound, $(C_6H_7FN)[FeCl_4]\cdot C_{12}H_{24}O_6$, which has an unusual supramolecular structure. N—H···O hydrogen-bonding interactions between the NH_3^+ substituents of the 4-fluoroanilinium cations and the O atoms of the crown ether molecules result in a rotator–stator-like structure.

4-Fluoroanilinium tetrachloridoferrate(III) 18-crown-6 clathrate

J.-Z. Ge and M.-M. Zhao

Comment

Crown ethers have attracted much attention because of their ability to form non-covalent, H-bonding complexes with ammonium cations both in solid and in solution (Fender *et al.* 2002). Both the size of the crown ether and the nature of the ammonium cation (-NH_4^+, RNH_3^+, *etc*) can influence the stoichiometry and stability of these host-guest complexes. The host molecules combine with the guest species by intermolecular interactions, and if the host molecule possess some specific sites (by chelate effect), it is easy to realise high selectivity in ion or molecular recognitions.18-crown-6 have the highest affinity for ammonium cation RNH_3^+ and most studies of 18-crown-6 and its derivatives invariably showed a 1:1 stoichiometry with RNH_3^+ cations.

In continuation of our investigations on ferroelectric phase transitions materials the dielectric permittivity of the title compound was tested (Fu *et al.* 2007; Ye *et al.* 2009; Zhang *et al.* 2009). The title compound shows no dielectric anomalies with values of 6-8 and 7-10 in the temperature ranges from 80 to 300 K and 300 K to 400 K (below the compound melting point 433 K), respectively. These findings suggest that the compound should exhibit no distinct phase transition within the measured temperature range.

The title compound crystallizes in the $P2_1/c$ space group. The asymmetric unit of the title compound is composed of a cationic $[(C_6H_4FN_3)\ (18\text{-Crown-6})]^+$ moiety and one isolated anionic $[FeCl_4]^-$ (Fig 1). The protonated *p*-fluoroanilinium $[C_6H_4FNH_3]^+$ and 18-crown-6 form a superamolecular rotator-stator-like structure by forming N—H···O hydrogen bonds between the -NH_3^+ substitutents of the cations and oxygen atoms of crown ethers. Intramolecular N—H···O hydrogen distances within the usual range: 2.950 (6) and 2.840 (6) Å. The crown ring is slight distorted. The six oxygen atoms of the crown ether lie approximately in a plane. The C—N bonds of $[C_6H_4FNH_3]^+$ are almost perpendicular to the mean oxygen plane.

The typical Fe—Cl bond lengths in the tetrahedral coordinate anion $[FeCl_4]^-$ are within 2.170 (3)-2.184 (2) Å. The Cl—Fe—Cl bond angles indicate little distortion from a regular tetrahedron [spread of values 108.3 (1)-110.7 (1)°].

Fig. 2 shows a view down the *a* axis. An alternate arrangement of cation and anion layers is observed along the *c* axis, a couple of head-to-head rotator-stator cations and an anion $[FeCl_4]^-$ along the *b* axis. No significantly short intermolecular hydrogen bond was observed.

Experimental

p-F-C_6H_4-NH_2 × HCl (2 mmol, 0.295 g) and 18-crown-6 (2 mmol, 0.528 g) were dissolved in methanol. After addition of ferric chloride (2 mmol, 0.54 g) in concentrated hydrochloric acid, a precipitate (yield is about 95%) was formed, filtered

and washed with a small amount of methanol. Single crystals suitable for X-ray diffraction analysis were obtained from slow evaporation of methanol and DMF (*v*/*v* 3/1) from the solution at room temperature after two days.

Refinement

All hydrogens were were calculated geometrically. The positions of the H atoms of the nitrogen atoms were refined using a riding model with N—H = 0.89 Å and U_{iso}(H) = 1.5U_{eq}(N). C—H groups were also refined using a riding model for hydrogen atoms with C—H distances ranging from 0.93 to 0.97 Å and U_{iso}(H) = 1.2Ueq(C).

Figures

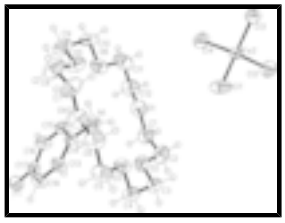

Fig. 1. The molecular structure of the title compound, with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

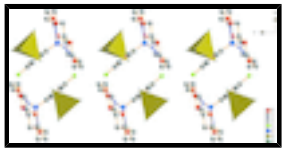

Fig. 2. A view of the packing of the title compound, stacking along the *a* axis. Dashed lines indicate hydrogen bonds.

4-Fluoroanilinium tetrachloridoferrate(III)–1,4,7,10,13,16-hexaoxacyclooctadecane (1/1)

Crystal data

$(C_6H_7FN)[FeCl_4]\cdot C_{12}H_{24}O_6$	$F(000)$ = 1188
M_r = 574.09	D_x = 1.430 Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, λ = 0.71073 Å
Hall symbol: -P 2ybc	Cell parameters from 5625 reflections
a = 11.45 (1) Å	θ = 2.3–27.5°
b = 24.14 (2) Å	μ = 1.00 mm^{-1}
c = 9.719 (9) Å	*T* = 293 K
β = 96.82 (2)°	Block, pale yellow
V = 2667 (4) Å^3	0.20 × 0.20 × 0.20 mm
Z = 4	

Data collection

Rigaku SCXmini diffractometer	6039 independent reflections
Radiation source: fine-focus sealed tube	3173 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.068
Detector resolution: 13.6612 pixels mm^{-1}	θ_{max} = 27.5°, θ_{min} = 2.3°
ω scans	*h* = −14→14
Absorption correction: multi-scan	*k* = −31→31

(*CrystalClear*; Rigaku, 2005)
T_{min} = 0.818, T_{max} = 0.818
26978 measured reflections

l = −12→12

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.078	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.271	H-atom parameters constrained
S = 1.07	$w = 1/[\sigma^2(F_o^2) + (0.1312P)^2 + 0.8151P]$ where $P = (F_o^2 + 2F_c^2)/3$
6039 reflections	$(\Delta/\sigma)_{max}$ = 0.005
281 parameters	$\Delta\rho_{max}$ = 0.49 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.35 e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

1,4-Dibromo-2,5-dimethoxybenzene

Z.-H. Luo, J. Chang, M.-L. Feng, Q. Zhang and H.-J. Zhu

Comment

The title compound, 1,4-dibromo-2,5-dimethoxybenzene is an important intermediate in the synthesis of 4-(2',5'-dimethoxy-4'-acetylthiophenyl)phenyl-nonafluorobiphenyl, which can be used as molecular switch, transistor and in the manufacture of memory devices (Chen *et al.*, 2006). We report here the crystal structure of the title compound, (I).

The molecular structure of (I) is shown in Fig. 1. Bond lengths and angles are within normal ranges (Allen *et al.*, 1987).

The benzene ring is planar and it's center respresents a crystallographic center of inversion. So only half of the molecule was observed in the asymmetric unit. No hydrogen bond interactions were observed in the crystal structure.

Experimental

The title compound, (I) was synthesized according to a literature method reported before (Lopez-Alvarado *et al.*, 2002). Single crystals were obtained by slow evaporation of a methanolic (25 ml) solution of the compound (0.30 g, 1.0 mmol) at room temperature for about 15 d.

Refinement

H atoms were positioned geometrically, with C—H = 0.93 Å for aromatic H and 0.96 Å for methyl H, and constrained to ride on their parent atoms, with U_{iso}(H) = xU_{eq}(C/O), where x = 1.2 for aromatic H and x = 1.5 for other H.

Figures

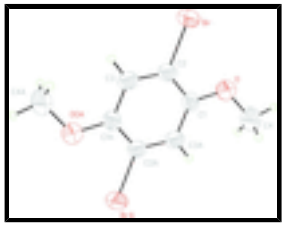

Fig. 1. Molecular structure of the title compound showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 40% probability level.

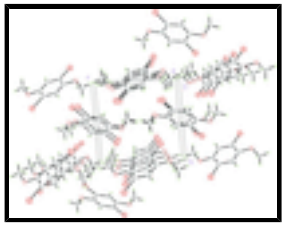

Fig. 2. Molecular packing of the title compound.

55 parameters	$\Delta\rho_{max} = 0.58$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.41$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

4-Methoxyanilinium hexafluorophosphate monohydrate

Yong-le Yang and Xue-qun Fu*

Ordered Matter Science Research Center, Southeast University, Nanjing 210096, People's Republic of China
Correspondence e-mail: fuxuequn222@163.com

Received 25 May 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.004 Å; disorder in main residue; R factor = 0.053; wR factor = 0.145; data-to-parameter ratio = 13.1.

In the structure of the title compound, $C_7H_{10}NO^+\cdot PF_6^-\cdot H_2O$, the protonated 4-methoxyanilinium cations and hexafluorophosphate anions are bridged by the water molecule *via* N—H···O and O—H···F hydrogen bonds. The resulting zigzag chains extend along the *c* axis. In addition, C—H···π interactions are observed in the crystal packing.

Related literature

The title compound was studied as part of our search for ferroelectric compounds, which usually have a phase transition. For background to phase-transition materials, see: Li *et al.* (2008); Zhang *et al.* (2009); Fu (2009).

4-Methoxyanilinium hexafluorophosphate monohydrate

Y. Yang and X. Fu

Comment

As a continuation of our study of dielectric-ferroelectric materials, including organic ligands (Li *et al.*, 2008), metal-organic coordination compounds (Zhang *et al.*, 2009) and organic-inorganic hybrid materials, we studied the dielectric properties of the title compound. Unfortunately, there was no distinct anomaly observed from 93 K to 350 K, suggesting that this compound should be not a real ferroelectric material or there may be no distinct phase transition occurred within the measured temperature range. The crystal structure of 4-methoxyanilinium bromide is known (Fu, 2009). In this article, the crystal structure of the title compound is presented.

The asymmetric unit of the title compound consists of an almost planar 4-methoxyanilinium cation with a mean deviation from the plan of 0.0512 Å, a disordered hexafluorophosphate anion and a water molecule (Fig.1). N—H···F, N—H···O and O—H···F hydrogen bonds link the cations, anions and water molecules to chains along *c* axis (Fig.2). The C—H···π interactions with a C7···*Cg*1 distance of 4.013 (5) Å are also observed in the crystal packing.

Experimental

1.23 g (10 mmol) 4-Methoxyaniline was dissolved in 10 ml e thanol, to which hexafluorophosphoric acid in aqueous solution (70% *w*/*w*) was then added under stirring until the pH of the solution was *ca* 6. Ethanol was added until all suspended substrates disappeared. Single crystals of the title compound were prepared by slow evaporation of the acidic solution at room temperature of the acidic solution after 3 days giving a yield of 85%.

Refinement

Positional parameters of all the H atoms bonded to C atoms were calculated geometrically and were allowed to ride on the C atoms to which they are bonded, with U_{iso}(H) = 1.2U_{eq}(C) and U_{iso}(H) = 1.5U_{eq}(C) for the methyl group. H atoms bonded to N and O atoms were found in the difference Fourier maps and were refined using restraints for O—H and N—H bond distances (0.85–0.86 Å) and angles at the corresponding O and N atoms. Thermal parameters of these hydrogen atoms were refined freely.

Figures

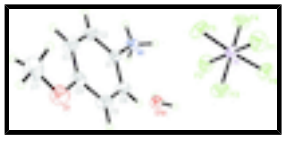

Fig. 1. Molecular structure of the title compound, with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

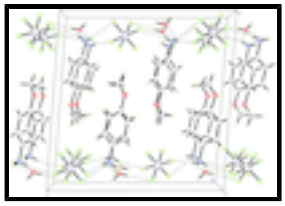

Fig. 2. View of the packing of the title compound, stacking along the *b* axis. Dashed lines indicate hydrogen bonds.

ω scans	$h = -19 \rightarrow 19$
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)	$k = -6 \rightarrow 6$
$T_{min} = 0.939$, $T_{max} = 0.939$	$l = -19 \rightarrow 18$
11166 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.053$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.145$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0694P)^2 + 0.5932P]$ where $P = (F_o^2 + 2F_c^2)/3$
2602 reflections	$(\Delta/\sigma)_{max} < 0.001$
199 parameters	$\Delta\rho_{max} = 0.45$ e Å^{-3}

3 restraints $\Delta\rho_{min} = -0.43$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters (Å^2)

Benzylammonium tetrafluoroborate 18-crown-6 clathrate

Min Min Zhao

Ordered Matter Science Research Center, College of Chemistry and Chemical, Engineering, Southeast University, Nanjing 211189, People's Republic of China
Correspondence e-mail: zmmzyahfdzg@126.com

Received 31 May 2010; accepted 4 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.045; wR factor = 0.103; data-to-parameter ratio = 18.1.

The reaction of benzylammonium tetrafluoroborate and 18-crown-6 in a methanolic solution yields the title compound, $C_7H_{10}N^+\cdot BF_4^-\cdot C_{12}H_{24}O_6$O6, which displays a supramolecular structure. The $-NH_3^+$ substituent of the benzylammonium cation forms a 1:1 supramolecular rotator–stator structure by N—H···O hydrogen-bonding interactions.

Related literature

Experimental

Crystal data

$C_7H_{10}N^+\cdot BF_4^-\cdot C_{12}H_{24}O_6$ M_r = 459.28
Triclinic, $P\overline{1}$
a = 9.281 (6) Å
b = 10.673 (6) Å
c = 11.863 (7) Å
α = 76.418 (16)°
β = 86.244 (17)°
γ = 78.274 (15)°
V = 1118.2 (12) Å^3
Z = 2
Mo $K\alpha$ radiation
μ = 0.12 mm^{-1}
T = 293 K
0.40 × 0.30 × 0.20 mm

Data collection

Rigaku SCXmini diffractometer
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)
T_{min} = 0.958, T_{max} = 0.976
12286 measured reflections
5057 independent reflections
4153 reflections with $I > 2\sigma(I)$
R_{int} = 0.031

Refinement

$R[F^2 > 2\sigma(F^2)]$ = 0.045
$wR(F^2)$ = 0.103
S = 1.03
5057 reflections
280 parameters
H-atom parameters constrained
$\Delta\rho_{max}$ = 0.25 e Å^{-3}
$\Delta\rho_{min}$ = −0.24 e Å^{-3}

Benzylammonium tetrafluoroborate 18-crown-6 clathrate

M. M. Zhao

Comment

There is currently a great deal of interest in crown ethers because of their ability to form non-covalent, H-bonding complexes with ammonium cations both in solid and in solution (Akutagawa *et al.*, 2002; Kryatova *et al.* 2004). Not only the size of the crown ether, but also the nature of the ammonium cation ($–NH_4^+$, RNH_3^+, $R_2NH_2^+$, *etc*) can influence both stoichiometry and stability of these host–guest complexes. The host molecules combine with the guest species by intermolecular interactions, and if the host molecule possesses some specific sites, it is easy to realise high selectivity in ion or molecular recognitions. 18-Crown-6 exhibits the highest affinity for ammonium cations RNH_3^+, mostly resulting in a 1:1 stoichiometry.

Dielectric permittivity of the title compound was tested to systematically investigate the ferroelectric phase transitions of new materials (Ye *et al.*, 2009; Zhang *et al.*, 2009). The title compound has no dielectric anomaly with the value of 5 and 8 under 1*M* Hz in the temperature range from 80 to 433 K (m.p.> 453 K), suggesting that the compound should show no distinct phase transition occurring within the measured temperature range.

The title compound is composed of cationic $[C_7H_{10}N(18\text{-Crown-6})]^+$ and anionic $[BF_4]^-$ ions in a 1:1 stoichiometry (Fig. 1). Supramolecular rotator-like structures are assembled between benzylammonium cations and 18-crown-6 molecules by N—H···O hydrogen-bonding. Intramolecular N—H···O hydrogen bonding lengths are within the usual range around 2.9 Å. No intermolecular hydrogen bond was observed.

The crown ether adopts a conformation in which the rings show some distortion from planarity, with torsion angles: O5—C8—C9—O3 = 64.5 (2) °; O2—C10—C13—O1 = 68.1 (2) °; C16—C17—O2—C10 = 176.0 (1) °; C10—C13—O1—C14 = 179.5 (1) ° and C8—C9—O3—C11 = 167.9 (1) °. C—N bonds of $[C_7H_{10}N]^+$ are almost perpendicular to the mean plane formed by oxygen atoms of the crown ether. Boron shows a slightly distorted tetrahedral coordination by four F^- ions [range of *cis*-bond angles = 108.9 (1) – 110.2 (1) °; average distance (B—F) = 1.383 (2)–1.397 (2) Å].

Experimental

$C_7H_{10}N^+BF_4^-$ (2 mmol, 0.388 g) and 18-crown-6 (2 mmol, 0.528 g) were dissolved in 15 ml methanol. The resulting precipitate was filtered. Two days later, single crystals suitable for X-ray diffraction analysis were obtained from slow evaporation of the remaining methanolic solution at 0°C (yield: 95%).

Refinement

All hydrogen atoms were calculated geometrically with C—H distances ranging from 0.93 to 0.97 Å and N—H = 0.90 Å. refinement of hydrogen atoms was performed using a riding model with $U_{iso}(H) = 1.2U_{eq}(C,N)$.

Figures

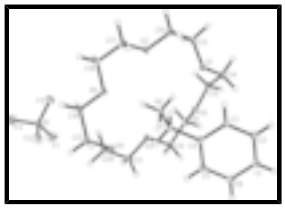

Fig. 1. Molecular structure of the title compound showingh the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

Benzylammonium tetrafluoroborate 1,4,7,10,13,16-hexaoxacyclooctadecane solvate

Crystal data

$C_7H_{10}N^+·BF_4^-·C_{12}H_{24}O_6$	$Z = 2$
$M_r = 459.28$	$F(000) = 488$
Triclinic, $P\overline{1}$	$D_x = 1.364$ Mg m^{-3}
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 9.281$ (6) Å	Cell parameters from 2953 reflections
$b = 10.673$ (6) Å	$\theta = 2.9$–$27.5°$
$c = 11.863$ (7) Å	$\mu = 0.12$ mm^{-1}
$\alpha = 76.418$ (16)°	$T = 293$ K
$\beta = 86.244$ (17)°	Prism, colorless
$\gamma = 78.274$ (15)°	0.40 × 0.30 × 0.20 mm
$V = 1118.2$ (12) Å^3	

Data collection

Rigaku SCXmini diffractometer	5057 independent reflections
Radiation source: fine-focus sealed tube	4153 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.031$
Detector resolution: 28.5714 pixels mm^{-1}	$\theta_{max} = 27.5°$, $\theta_{min} = 2.7°$
ω scans	$h = -12 \rightarrow 12$
Absorption correction: multi-scan (*CrystalClear*; Rigaku, 2005)	$k = -13 \rightarrow 13$
$T_{min} = 0.958$, $T_{max} = 0.976$	$l = -15 \rightarrow 15$
12286 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.103$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0454P)^2 + 0.2316P]$

	where $P = (F_o^2 + 2F_c^2)/3$
5057 reflections	$(\Delta/\sigma)_{max} < 0.001$
280 parameters	$\Delta\rho_{max} = 0.25$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.24$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 1 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.005 Å; R factor = 0.070; wR factor = 0.180; data-to-parameter ratio = 15.4.

In the title compound, $C_{10}H_{13}NO$, the N atom and the methyl group are almost coplanar with the benzene ring to which they are bonded [deviations of 0.131 (1) and 0.038 (1) Å, respectively, from the ring plane]. In the crystal structure, intermolecular C—H···O hydrogen bonds form a three-dimensional network. Molecules are stacked parallel to the *b*-axis direction.

Related literature

N-Methyl-*N*-(2-methylphenyl)acetamide

Z.-W. Yan, Y.-H. Li, Q. Xiao, L. Zhao and H.-J. Zhu

Comment

The title compound, (I), contains acetyl group, which can react with different groups to prepare various function organic compounds. It is a kind of aromatic organic intermediate which can be used for many fields such as medicine. (Cai *et al.*, 2007). Herein we report its crystal structure.

In the molecule of (I), (Fig.1), the bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. The N and C7 atoms are situated in the same plane as the benzene ring they are bonded to. The C—H···O intermolecular hydrogen bonds form a three dimensional network, which seems to be very effective in the stabilization of the crystal structure.

As can be seen from the packing diagram, (Fig. 2), the molecules are stacked along the *b* axis. There are also weak π-π interactions of benzene rings with a face-to-face stacking distance of 5.991 (4) Å.

Experimental

The title compound, (I) was prepared by the literature method (Cai *et al.*, 2007). Crystals suitable for X-ray analysis were obtained by dissolving (I) (0.5 g) in ethyl acetate (20 ml) and evaporating the solvent slowly at room temperature for about 7 d.

Refinement

All H atoms were positioned geometrically and constrained to ride on their parent atoms, with C—H = 0.93 Å and 0.96 Å for aromatic H and methyl group H, respectively. The U_{iso}(H) = xU_{eq}(C), where x = 1.2 for aromatic H, and x = 1.5 for other H.

Figures

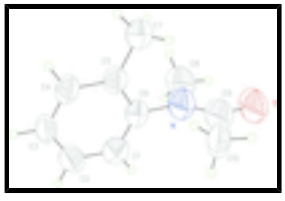

Fig. 1. Molecular structure of (I) with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

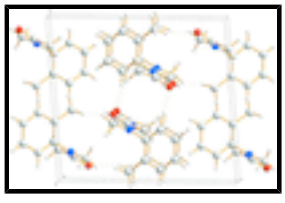

Fig. 2. Packing diagram of (I). Hydrogen bonds are shown as dashed lines.

N-Methyl-*N*-(2-methylphenyl)acetamide

Crystal data

$C_{10}H_{13}NO$	$F(000) = 352$
$M_r = 163.21$	$D_x = 1.142$ Mg m^{-3}
Monoclinic, $P2_1/n$	Melting point: 328 K
Hall symbol: -P 2yn	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
$a = 11.288$ (2) Å	Cell parameters from 25 reflections
$b = 6.900$ (1) Å	$\theta = 9–13°$
$c = 12.234$ (2) Å	$\mu = 0.07$ mm^{-1}
$\beta = 94.88$ (3)°	$T = 293$ K
$V = 949.5$ (3) Å^3	Block, colourless
$Z = 4$	0.30 × 0.20 × 0.10 mm

Data collection

Enraf–Nonius CAD-4 diffractometer	1044 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.055$
graphite	$\theta_{max} = 25.3°$, $\theta_{min} = 2.4°$
$\omega/2\theta$ scans	$h = 0\rightarrow13$
Absorption correction: ψ scan (North *et al.*, 1968)	$k = -8\rightarrow8$
$T_{min} = 0.978$, $T_{max} = 0.993$	$l = -14\rightarrow14$
3465 measured reflections	3 standard reflections every 200 reflections
1726 independent reflections	intensity decay: 1%

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.070$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.180$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.060P)^2 + 0.550P]$ where $P = (F_o^2 + 2F_c^2)/3$
1726 reflections	$(\Delta/\sigma)_{max} < 0.001$
112 parameters	$\Delta\rho_{max} = 0.32$ e Å^{-3}
4 restraints	$\Delta\rho_{min} = -0.16$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Polymorphic form II of 4,4′-methylenebis(benzenesulfonamide)

Thomas Gelbrich,* Mairi F. Haddow‡ and Ulrich J. Griesser

Institute of Pharmacy, University of Innsbruck, Innrain 52, 6020 Innsbruck, Austria
Correspondence e-mail: thomas.gelbrich@uibk.ac.at

Received 1 June 2010; accepted 4 June 2010

Key indicators: single-crystal X-ray study; T = 120 K; mean σ(C–C) = 0.004 Å; R factor = 0.038; wR factor = 0.087; data-to-parameter ratio = 11.3.

In the title compound, $C_{13}H_{14}N_2O_4S_2$ (alternative names: diphenylmethane-4,4′-disulfonamide, nirexon, CRN: 535–66-0), the two benzene rings form a dihedral angle of 70.8 (1)°. There are two sets of shorter (H···O < 2.1 Å) and longer (H···O > 2.4 Å) N—H···O hydrogen bonds per sulfonamide NH_2 group, which together result in hydrogen-bonded sheets parallel (102). Adjacent sheets are connected to one another by an additional N—H···N interaction so that a three-dimensional network of hydrogen-bonded molecules is formed. The investigated polymorph is identical with the form II previously described by Kuhnert-Brandstätter & Moser [(1981). *Mikrochim. Acta*, **75**, 421–440].

Polymorphic form II of 4,4'-methylenebis(benzenesulfonamide)

T. Gelbrich, M. F. Haddow and U. J. Griesser

Comment

The polymorphic behaviour of the title compound, a carbonic anhydrase inhibitor with diuretic effects, was described by Kuhnert-Brandstätter & Moser (1981) and Kuhnert-Brandstätter & Wunsch (1969), who identified five distinct polymorphic modifications. The commercial product contained form II (mp. 172–174 °C), which was also found to be the stable polymorph at room temperature. The identity of the crystals investigated in the present study with form II reported by Kuhnert-Brandstätter & Moser (1981) was established by thermomicroscopy and IR spectroscopy. The asymmetric unit contains a single molecule (Fig. 1). Its central plane, defined by S1, S2, C1, C11, C14, C21 and C24, forms angles of 21.8 (1)° and 78.7 (1)° with the mean planes of the two phenyl rings C11 > C16 and C21 > C26, respectively. The two sulfonamide groups are differently oriented with respect to the adjacent phenyl ring, so that the corresponding torsion angles N1—S1—C1—C24 and N2—S2—C1—C14 are 115.6 (2)° and 53.3 (2)°, respectively. Each molecule is connected to four other molecules by four short N—H···O bonds (H···O < 2.1 Å, see Table 2) so that an H-bonded sheet parallel to (102) is formed. The symmetry operation between molecules linked by these primary interactions involving one H-bond donor and one acceptor site of each sulfonamide group is a twofold screw axis. There are two additional N—H···O contacts (H···O > 2.4 Å, see Table 2) within the same plane so that all four NH hydrogen bond donor sites are employed once. These secondary N—H···O bonds link molecules related by a translation along [010]. The O3 and O4 sites of one sulfonyl group accept one H-bond each, while in the group O1 accepts two H-bonds. Thus, the sulfonamide groups of molecules in the hydrogen bonded sheet form two distinct chains of fused rings both propagating parallel to [010]. One chain consists of ten-membered rings with two H-bond donor and two acceptor sites (labeled 'A' in Fig. 2), and the other is generated from 9-membered rings with two three H-bond donor and two acceptor sites ('B'). Each of the N—H···O sheets is linked to two neighbouring sheets by a N2—H···N1(-*x* + 1, *y* + 1/2, -*z* + 1) interaction (represented by arrows in Fig. 2). Thus, this crystal structure contains a three-dimensional network of N—H···O and N—H···N bonded molecules of diphenylmethane-4,4'-disulfonamide.

Experimental

The crystals for this study were obtained from a commercial sample of diphenylmethane-4,4'-disulfonamide (Farbenfabriken Bayer AG, Leverkusen).

Refinement

All H atoms were identified in a difference map. H atoms bonded to secondary CH_2 (C—H = 0.99 Å) and aromatic carbon atoms (C—H = 0.95 Å) were positioned geometrically. Hydrogen atoms attached to N were refined with restrained distances [N—H = 0.88 (12) Å].The U_{iso} parameters of all H atoms were refined freely.

Figures

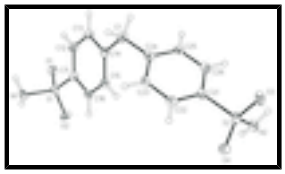

Fig. 1. The molecular structure with displacement ellipsoids drawn at the 50% probability level and hydrogen atoms shown as spheres of arbitrary size.

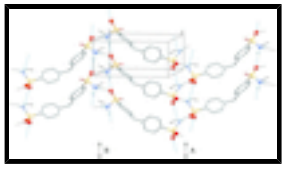

Fig. 2. Portion of a single hydrogen bonded sheet parallel to (102) and generated by shorter N—H···O bonds (dotted lines) and longer N—H···O bonds (dashed lines). N—H···N bonds (arrows) connect to neighbouring sheets. O, H and N atoms directly involved in hydrogen bonds are drawn as balls.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.038$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.087$	$w = 1/[\sigma^2(F_o^2) + (0.0361P)^2 + 0.182P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{max} = 0.001$
2438 reflections	$\Delta\rho_{max} = 0.26$ e Å^{-3}
216 parameters	$\Delta\rho_{min} = -0.46$ e Å^{-3}
5 restraints	Absolute structure: Flack (1983), 904 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: −0.18 (9)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

2-(Bicyclo[2.2.1]hept-5-en-2-yl)-1*H*-pyrrolo[2,3-*b*]pyridine

R. Selig, D. Schollmeyer, W. Albrecht and S. Laufer

Comment

The interest in 7- azaindoles as bioisoster of indole or purine has arisen in conjunction with recent pharmacological programs. Numerous publications on its derivatization reflect the increasing attention paid to this heterocyclic system. The crystal structure of 2-bicyclo[2.2.1]hept-5-en-2-yl-1*H*-pyrrolo[2,3-*b*]pyridine, $C_{14}H_{14}N_2$, is characterized by an intermolecular hydrogen bond N1—H1··· N7 (2.05 Å) forming dimers of enantiomeric molecules, which are related by a crystallographic centre of symmetry.

Experimental

3-methylpyridine (4 g, 43 mmol) was added dropwise to a freshly prepared solution of LDA in THF (0.9*M*) (59 ml, 53 mmol) at 273 K. The resulting suspension was stirred at 273 K for 30 min. Racemic 5-norbornene-2-carbonitrile (5.12 g, 43 mmol) was added dropwise at such a rate that the temperature did not rise above 283 K. Stirring was continued for 60 min. at 273 K. Another portion of LDA solution (59 ml, 53 mmol) was added and stirring was continued overnight at 333 K. The final reaction mixture was allowed to cool and ice-water was added. The mixture was extracted with ethylacetate and the combined extracts were dried (Na_2SO_4) and the solvent was evaporated under reduced pressure. The residue was subjected to flash chromatography. The title compound was obtained in a yield of 31% (2.834 g, 13.48 mmol). Crystals suitable for X-ray analysis were obtained by slow evaporation of the solvent from a methanolic solution.

Refinement

Hydrogen atoms attached to carbons were placed at calculated positions with C—H = 0.95 Å (aromatic) or 0.98–0.99 Å (sp^3 C-atom). All H atoms were refined in the riding-model approximation with isotropic displacement parameters (set at 1.2–1.5 times of the U_{eq} of the parent atom). The hydrogen atom attached to N1 was located in diff. Fourier maps and refined using a fixed isotropic displacement parameter and applying a riding motion model.

Figures

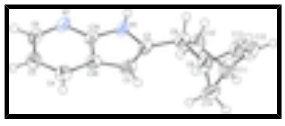

Fig. 1. Molecular structure of compound **I**. Displacement ellipsoids are drawn at the 50% probability level. H atoms are depicted as circles of arbitrary size.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.082	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.227	H-atom parameters constrained
S = 1.09	$w = 1/[\sigma^2(F_o^2) + (0.1178P)^2 + 1.2641P]$ where $P = (F_o^2 + 2F_c^2)/3$
2113 reflections	$(\Delta/\sigma)_{max} < 0.001$
145 parameters	$\Delta\rho_{max}$ = 0.47 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.36 e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.006 Å; R factor = 0.040; wR factor = 0.103; data-to-parameter ratio = 8.2.

In the title compound, $C_{15}H_{23}N_3O_4$, the six-membered pyran, cyclohexane and trioxane rings adopt chair, chair and boat conformations, respectively, while the seven-membered rings adopt distorted boat and very distorted chair conformations. In the crystal, adjacent molecules are connected by weak C—H···N and C—H···O interactions.

Comment

Artemisinin, a sesquiterpene endoperoxide isolated from Artemisia annua *L*, is being widely used to treat drug-resistant malaria (Liu *et al.*, 1979). In addition, Artemisinin and its derivatives also showed potent and broad anticancer properties in different human cancer cell lines and animal models (Efferth *et al.*, 1996). These compounds contain an endoperoxide bridge (R—O—O—*R*) which is required for their biological activities. Recently, there are many reports about significant anticancer activities of artemisinin derivatives, which were expected to be more stable toward the metabolism process (Chadwick *et al.*, 2009; Galal *et al.*, 2009). Herein, we present the synthesis and structure of an artemisinin derivatives, (1*R*,3S,4*R*,4aS,7*R*,7aS,10*R*,12aR)-3-Azido- 4,7,10-trimethyl-1,10-epoxy-decahydro- 12*H*-pyrano[4,3-*j*]-1,2-benzodioxepin.

The crystal structure of the title compound is given in Fig. 1. The bond lengths and angles in the title compound are found to have normal values with respect to highly related compounds (Gul *et al.*, 2009; Jasinski *et al.*, 2008). The six membered rings A, B and C adopt chair, chair and boat conformations, respectively. In the crystal, adjacent molecules are connected by non-classical C—H···N and C—H···O hydrogen bonding, with the distance of 3.628 (6), 3.508 (5) and 3.535 (5) Å (Table 1), respectively.

Experimental

Trimethylchlorosilane (300 mmol, 38.1 ml) was added gradually to a solution of dihydroartemisinin (200 mmol, 56.8 g, diastereomeric mixture with *R* and *S* configuration at C(3)) and sodium azide (300 mmol, 19.5 g) in CH_2Cl_2 (300 ml). Then sodium iodide (20 mmol, 3.0 g) was added to the reaction mixture at low temperature. The reaction mixture was stirred at room temperature for 28 h. The mixture was quenched with a saturated $NaHCO_3$ solution (100 ml) and diluted with CH_2Cl_2. Two phases were separated and the organic phase was washed with brine, dried over $MgSO_4$, filtered, and concentrated under reduced pressure. The crude mixture was purified by column chromatography (silica, 1%-5% EtOAc/hexanes) to furnish the product (94 mmol, 29.0 g) and it's diastereomer with *R* configuration at C(3). Colorless single crystals of the title compound was obtained in CH_2Cl_2 solution after 10 days by slow evaporation at room temperature.

Refinement

In the absence of significant anomalous dispersion effects, Friedel pairs were averaged. All H-atoms were positioned geometrically and refined using a riding model, with C—H = 0.96 Å (CH_3), 0.97 Å (CH_2), 0.98 Å (CH), and U_{iso}(H) =1.2U_{eq}(C).

Figures

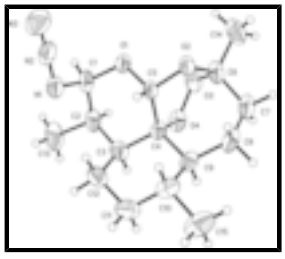

Fig. 1. Molecular structure of the title compound, showing 30% probability displacement ellipsoids and the atom-numbering scheme.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.103$	H-atom parameters constrained
$S = 1.09$	$w = 1/[\sigma^2(F_o^2) + (0.0312P)^2 + 0.4488P]$ where $P = (F_o^2 + 2F_c^2)/3$

1657 reflections	$(\Delta/\sigma)_{max} < 0.001$
202 parameters	$\Delta\rho_{max} = 0.12$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.16$ e Å^{-3}

Special details

Experimental. We took dihydroartemisinin (mixture of 3R and 3S isomers of hydroxyl group) as the starting material in our experiment. During the course of synthesis, we got a mixture of two diastereomers with 3S and 3R and all other stereogenic centers are known and still in the configuration as they were in the starting compound. The mixture was separated by silica gel column chromatography and the title compound with 3S was crystallized under our conditions, while the other one (3R) was obtained as amorphous powder.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 16 June 2010; accepted 23 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.052; wR factor = 0.131; data-to-parameter ratio = 16.4.

In the reaction of naphthalene-2,3-diol and 4-aminoantipyrine in the presence of acetic acid, the amine function is acetylated and the resulting acetamide co-crystallizes with the diol in the title compound, $C_{13}H_{15}N_3O_2\cdot C_{10}H_8O_2$, with 1:1 molar stoichiometry. The two components are linked by two O–H···O=C hydrogen bonds. One of the hydroxy groups interacts with the pyrazolone carbonyl O atom and the other hydroxy group interacts with the amide O atom of another component, generating a chain motif. Adjacent chains are linked into a layer motif *via* N—H···O interactions involving only the heterocyclic acetamide component.

N-(1,5-Dimethyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazol-4-yl)acetamide-naphthalene-2,3-diol (1/1)

A. M. Asiri, S. A. Khan, K. W. Tan and S. W. Ng

Comment

Naphthalene-2,3-diol forms co-crystals with a number of neutral organic compounds (Fritchie & Johnston, 1975; Herbert & Truter, 1980; Kuo *et al.*, 1974; Nakamatsu *et al.*, 2003; Wang *et al.*, 2008; Wells *et al.*, 1974). The attempt to co-crystallize it with the drug 4-aminoantipyrine was sussessful when the reaction was carried out in the presence of acetic acid, but the acetic acid converted the amino group to an acetamido group instead. In the co-crystal (Scheme I, Fig. 1), the acetamide and the diol are linked by two *O*–H···O═C hydrogen bonds. One of the hydroxy groups interacts with the pyrazolyl carbonyl O-atom and the other hydroxy group interacts with the amido O-atom of another component to generate a chain motif. Adjacent chains are linked into a layer motif *via* N–H···O interactions that involves the acetamide component only.

Experimental

Naphthalene-2,3-diol (0.35 g, 2.2 mol) and 4-aminoantipyrine (0.45 g, 2.2 mmol) were heated in methanol (15 ml) for 5 h; three drops of acetic acid were added. Crystals separated from the cool solution when it was set aside for a day.

Refinement

Carbon-bound H-atoms were placed in calculated positions [C–H 0.95 to 0.98 Å, U(H) = 1.2 to 1.5U_{eq}(C)] and were included in the refinement in the riding model approximation. The hydroxy and amino H-atoms were located in a difference Fourier map, and were refined with distance restraints of O–H 0.84±0.01Å and N–H 0.86±0.01 Å. Their temperature factors were freely refined.

The anisotropic temperature factors of C17 to C20 atoms of the naphthalene fused-ring were restrained to be nearly isotropic and with the restraints, the ellipsoids were somewhat elongated.

Figures

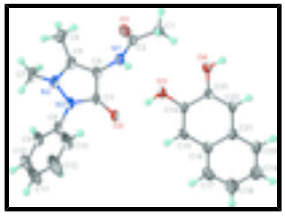

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of the ($C_{13}H_{15}N_3O_2$)($C_{10}H_8O_2$) co-crystal at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius.

N-(1,5-Dimethyl-3-oxo-2-phenyl-2,3-dihydro-1*H*-pyrazol-4- yl)acetamide–naphthalene-2,3-diol (1/1)

Crystal data

$C_{13}H_{15}N_3O_2 \cdot C_{10}H_8O_2$	$F(000) = 856$
$M_r = 405.44$	$D_x = 1.322$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 2505 reflections
$a = 12.426$ (1) Å	$\theta = 2.3$–$27.9°$
$b = 14.304$ (2) Å	$\mu = 0.09$ mm^{-1}
$c = 12.959$ (1) Å	$T = 100$ K
$\beta = 117.845$ (1)°	Prism, colorless
$V = 2036.7$ (4) Å^3	0.25 × 0.25 × 0.10 mm
$Z = 4$	

Data collection

Bruker SMART APEX diffractometer	3189 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{int} = 0.061$
graphite	$\theta_{max} = 27.5°$, $\theta_{min} = 1.9°$
ω scans	$h = -16 \rightarrow 16$
19263 measured reflections	$k = -18 \rightarrow 18$
4683 independent reflections	$l = -16 \rightarrow 16$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.052$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.131$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0544P)^2 + 0.6929P]$ where $P = (F_o^2 + 2F_c^2)/3$
4683 reflections	$(\Delta/\sigma)_{max} = 0.001$
286 parameters	$\Delta\rho_{max} = 0.31$ e Å^{-3}
27 restraints	$\Delta\rho_{min} = -0.35$ e Å^{-3}

Correspondence e-mail: sky37@zjnu.cn

Received 20 April 2010; accepted 12 May 2010

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.003 Å; R factor = 0.036; wR factor = 0.084; data-to-parameter ratio = 13.7.

In the title compound, $[Zn(C_8H_5NO_5)(H_2O)_5]\cdot H_2O$, the Zn^{II} atom is coordinated by one O atom from the 2-(5-carboxylato-2-oxidopyridinium-1-yl)acetate ligand and by five water molecules, forming a distorted octahedral geometry. Coordinated and uncoordinated water molecules form O—H···O hydrogen bonds, leading to a three-dimensional framework.

Pentaaqua[2-(5-carboxylato-2-oxido-1-pyridinio)acetato]zinc(II) monohydrate

J. Chen and Y.-L. Feng

Comment

The pyridinium carboxylate ligands, containing both of carboxylate and quaternary ammonium groups, have been extensively employed to design and construct novel complexes due to its versatile coordination behavior to metal ions (Zhang *et al.*, 2003; Szafran *et al.*, 2006; Yang *et al.*, 2010). Herein, we report the synthesis and crystal structure of a new complex, $[ZnL(H_2O)_5].H_2O$ (LH_2 = 5-carboxy-1-carboxymethyl-2-oxidopyridinium; He & Feng, 2007).

As shown in Fig. 1, the metal center Zn^{II} atom is six-coordinated by one O atom from one L^{2-} ligand [Zn—O 2.1039 (16) Å] and five water molecules [Zn—O 2.0554 (17)–2.0988 (19) Å], to form a distorted octahdral geometry. Notably, only one O atom from the flexible carboxylic groups of L^{2-} ligand coordinates to the Zn^{II} ion. As shown in Fig. 2, the complexes connected with each other by the O—H···O hydrogen bonds generate a three-dimensional structure.

Experimental

All the starting materials and solvents were obtained commercially and were used without further purification. A mixture of *N*-carboxymethyl-2-oxo-pyridine-5-carboxylic acid (0.1972 g, 1 mmol), $ZnNO_3$ (0.1901 g, 1 mmol), and purified water (15 ml) was sealed in a 25 ml stainless steel reactor and kept at 393 K for 3 d. Then, the reactor was cooled to room temperature at a speed of 5 K/h. A large quantity of colorless single crystals were filtered out of the mixture with the yield of 85%.

Refinement

The C-bound H atoms were positioned geometrically and included in the refinement using a riding model, with C—H = 0.93 or 0.97 Å, and with U_{iso}(H) = 1.2U_{eq}(C). The O-bound H atoms was located in a difference Fourier map and refined, with the distance restraint of O—H = 0.82 (2) Å, and with U_{iso}(H) = 1.2U_{eq}(O).

Figures

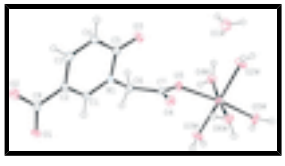

Fig. 1. The molecular structure of the title compound, with 30% probability displacement ellipsoids.

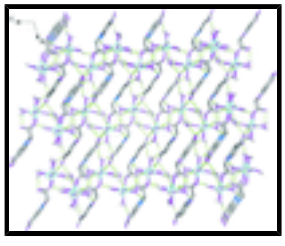

Fig. 2. Three-dimensional framework with hydrogen bonding interactions.

Crystal data

$[Zn(C_8H_5NO_5)(H_2O)_5]\cdot H_2O$	$F(000) = 760$
$M_r = 368.60$	$D_x = 1.826$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 6642 reflections
$a = 10.9584$ (4) Å	$\theta = 1.9$–$27.6°$
$b = 7.5548$ (4) Å	$\mu = 1.89$ mm^{-1}
$c = 16.6510$ (7) Å	$T = 293$ K
$\beta = 103.498$ (3)°	Prism, colourless
$V = 1340.43$ (10) Å^3	0.36 × 0.09 × 0.05 mm
$Z = 4$	

Data collection

Bruker APEXII area-detector diffractometer	3086 independent reflections
Radiation source: fine-focus sealed tube	2233 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.100$
ω scans	$\theta_{max} = 27.6°$, $\theta_{min} = 1.9°$
Absorption correction: multi-scan (*SADABS*; Sheldrick, 1996)	$h = -14\rightarrow14$
$T_{min} = 0.824$, $T_{max} = 0.918$	$k = -9\rightarrow8$
19343 measured reflections	$l = -21\rightarrow19$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.084$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.0382P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3086 reflections	$(\Delta/\sigma)_{max} < 0.001$
226 parameters	$\Delta\rho_{max} = 0.48$ e Å^{-3}
18 restraints	$\Delta\rho_{min} = -0.79$ e Å^{-3}

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds

in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.004 Å; R factor = 0.036; wR factor = 0.082; data-to-parameter ratio = 17.3.

In the title coordination polymer, $[Zn(C_8H_4O_4)(C_5H_5N)_2]_n$, the Zn^{II} atom, located on a twofold rotation axis, is tetracoordinated by two monodentate O atoms from two different carboxylate groups and two pyridyl N atoms, forming a distorted tetrahedral geometry. The Zn^{II} atoms are bridged by terephthalate ligands, generating an infinite zigzag chain along [101].

Comment

A great number of the crystal structures of one-dimensional chain complexes have been extensively investigated (Li *et al.* 2007; Mori *et al.* 2004), in most of which interchain hydrogen bonds or π–π interactions connect the chains to produce two-dimensional or three-dimensional structures. Here, we report the synthesis and crystal structure of a new one-dimensional zigzag coordination polymer.

In the title coordination polymer, each Zn(II) atom is four-coordinated. The coordination environment around the Zn(II) ions represents a slightly distorted tetrahedral geometry with two pyridyl N and two monodentate O atoms from two different carboxylates. The Zn centers are interconnected by terephthalate ligands to form an infinite zigzag chain. The Zn—O bond distance between Zn(II) and carboxylate O atom is 1.9622 (18) Å, and the Zn—N bond distance between Zn(II) and the N atom of the pyridine is 2.038 (2) Å.

Experimental

A solution containing a 2:1 molar ratio of 1,4-benzenedicarboxylic acid (0.022 g) and zinc nitrate hexahydrate (0.041 g) in a mixture of pyridine (2 ml) and *N*,*N*-dimethylformamide (2 ml) was sealed in a 5 ml transparent vitreous reactor and kept at 343 K for 5 days, and then cooled to room temperature. The mixture was filtered and colorless crystals suitable for the X-ray investigation were collected.

Refinement

All H atoms were positioned geometrically (C—H = 0.95 Å) and treated as riding, with U_{iso}(H) = 1.2U_{eq}(C).

Figures

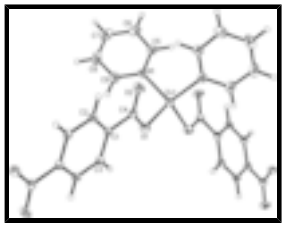

Fig. 1. A view of the molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level. Hydrogen atoms have been omitted for clarity.

Fig. 2. An illustration of the zigzag chain formed by bridging terephthalate ligands. H atoms have been omitted.

114 parameters	$\Delta\rho_{max} = 0.35$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.22$ e Å^{-3}

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > 2\,\sigma(F^2)$ is used only for calculating *R*-factors (gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 298 K; mean σ(C–C) = 0.002 Å; R factor = 0.035; wR factor = 0.099; data-to-parameter ratio = 12.5.

In the title compound, $C_{10}H_{19}NO_2$, the piperidine and pyrrolidine rings of the perhydroindolizine ring system adopt chair and envelope conformations, respectively. In the crystal structure, intermolecular O—H···N and O—H···O hydrogen bonds link the molecules into a chain running along the *a* axis.

Comment

Bridgehead nitrogen heterocycles are important natural products. Among them, indolizines have received much attention in recent years due to their intriguing molecular structures featured with a 10 *p*-delocalized electrons. They have been extensively examined because of its wide range of potent applications such as biological activities (Bonneau *et al.*, 2003) and a fluorescent probe (Delattre *et al.*, 2005). These molecules have found various pharmaceutical applications as anti-tuberculosis agents (Gundersen *et al.*, 2007), histamine H3 receptor antagonists (Chai *et al.*, 2003), 5-HT3 receptor antagonists (Bermudez *et al.*, 1990), associated with many infectious diseases (Weide *et al.*, 2006) and as 15-lipoxygenase inhibitors (Teklu *et al.*, 2005). Indolizines demonstrate also antifungal, antimycobacterial, antiherpes and antineociceptive properties (Liu *et al.*, 2007). Thus, there is a growing interest in the synthesis and study of crystal and molecular structures of indolizine derivatives.

Based on these facts and in continuation of our interest in developing simple and efficient route for the synthesis of novel monohydroxylated indolizine derivatives, we report here the synthesis, molecular and crystal structure of the title compound, (I). The absolute configuration was established by synthesis and is depicted in the scheme and figure. The expected stereochemistry of atoms C5, C6, C7 and C8 was confirmed as S, R, S and S, respectively (Fig. 1). The central six-membered ring is not planar and adopts a chair conformation (Cremer & Pople, 1975). A calculation of least-squares planes shows that this ring is puckered in such a manner that the four atoms C6, C7, C9 and N1 are coplanar to within 0.019 (2) Å, while atoms C5 and C8 are displaced from this plane on opposite sides, with out-of-plane displacements of -0.720 (2) and 0.636 (1) Å, respectively. In the molecule, the pyrrolidine ring N1/C2–C5 exhibits an envelope conformation with envelope on atom N1 (Nardelli, 1983). The displacement of atom N1 from the mean plane of the remaining four atoms is 0.625 (2) Å. The N1—C2, N1—C5 and N1—C9 bonds are approximately equivalent. Atom N1 is sp^3-hybridized, as evidenced by the sum of the valence angles around it [327.05 (2)°]. Intermolecular O—H···N and O—H···O hydrogen bonds link the neighbouring molecules of (I) into extended chains, which run parallel to the a axis (Fig. 2) and help to stabilize the crystal structure of the compound. Atom N1 (O1) participates as acceptor and atom O1 (O12) as donator in these intermolecular hydrogen bonds.

Experimental

The title compound (6*S*,7*S*,8*R*,8aS)-6-ethylperhydroindolizine-7,8-diol was prepared according literature procedures of Šafař *et al.* (2010).

Refinement

Hydroxyl H atoms were located in a difference Fourier map and their positions were refined freely, with $U_{iso}(H) = 1.2U_{eq}(O)$. Other H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances in the range 0.93–0.98 Å, and with $U_{iso}(H) = 1.2U_{eq}(C)$. The absolute configuration could not be reliably determ-

ined for this compound using Mo radiation, and has been assigned according to the synthesis. 1061 total Friedel pairs have been merged.

Figures

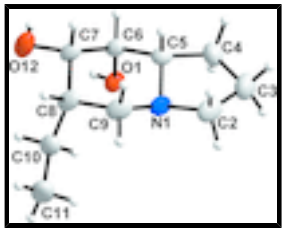

Fig. 1. Molecular structure of (I) with the atomic numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

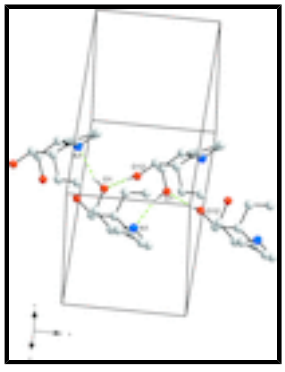

Fig. 2. A partial packing diagram of the molecule of (I), showing a molecular chain along the *a* axis. Hydrogen bonds are indicated by dashed lines. H atoms not involved in the hydrogen bonds have been omitted.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.035	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.099	H atoms treated by a mixture of independent and constrained refinement
S = 1.07	$w = 1/[\sigma^2(F_o^2) + (0.0669P)^2 + 0.0442P]$ where $P = (F_o^2 + 2F_c^2)/3$
1554 reflections	$(\Delta/\sigma)_{max} < 0.001$
124 parameters	$\Delta\rho_{max}$ = 0.17 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −0.18 e Å^{-3}

Special details

Experimental. (face-indexed; Oxford Diffraction, 2006)

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor wR and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.042; wR factor = 0.159; data-to-parameter ratio = 37.8.

The title Schiff base compound, $C_{22}H_{24}IN_3O_2$, adopts an E configuration about the central C=N bond. The pyrazolone ring makes a dihedral angle of 49.68 (10)° with its attached phenyl ring. The phenolate plane makes dihedral angles of 16.78 (9) and 50.54 (9)°, respectively, with the pyrazolone ring and the terminal phenyl ring. An intramolecular C—H···O hydrogen bond generates an S(6) ring motif. In the crystal structure, an intermolecular C—H···O hydrogen bond is also observed.

Comment

Schiff bases are generally synthesized from the condensation of primary amines and active carbonyl group. Various heterocyclic ring containing Schiff bases were reported to possess cytotoxic (Tarafder *et al.*, 2002), anticonvulsant (Silver & Soderlund, 2005), antiproliferative (Vicini *et al.*, 2003), anticancer and antifungal activities (Ozdemir *et al.*, 2007). It's also used as ligands for the complexes synthesis (Joshi *et al.*, 2004). As evident from the literature, it was noted that a lot of research has been carried out on Schiff bases but no work has been done on the long chain Schiff base. 4-Aminoantipyrene, which contain pyrazolone ring, is an important compound in the class analgesic agent in otic solutions in combination with other analgesic such as benzocaine and phenylephrine. Pyrazolone is a five-membered lactam ring compound containing two N atoms and ketone in the same molecule. Lactam structure is an active nucleus in pharmacological activity, especially in the class of nonsteroidal antiinflammatory agents used in the treatment of arthritis and other musculo skeletal and joint disorders. Pyrazolone derivatives, as lactam structure related compounds, are also widely used in preparing dyes and pigments. 4-Aminoantipyrene and its derivatives have potential biological activities (Jain *et al.*, 2003). Analgesic and antiinflammatory activities of the 4-aminoantipyrene complexes were extensively studied and reported (Filho *et al.*, 1998; Sondhi *et al.*, 1999). Apart from that, antimicrobial and anticancer activity of the 4-aminoantipyrine derivatives and their metal complexes caught the attention of many researchers during last decade (Mishra, 1999; Sondhi *et al.*, 2001). In this paper we report the synthesis and the crystal structure of a mono Schiff base bearing butyl iodide side chain. It is noteworthy that the alkylating agent used in this reaction is dibromo butyl, and after obtaining the *O*-alkylation product, the charge transfer catalyst used caused the free bromide atom to be substituted by an iodide atom.

The title compound (I) is shown in Fig. 1. The molecule adopts a trans configuration about the central C10═N3 double bond. The C—N bond lengths of N1—C6 [1.422 (2) Å], N1—C9 [1.398 (2) Å], N2—C21 [1.459 (3) Å], N2—C7 [1.365 (2) Å] and N3—C8 [1.389 (2) Å] are normal for C—N single-bond distances. The distance between C10—N3 [1.290 (2) Å] is typical for a C═ N double-bond distance. These bonds are comparable with those in *N*-(1*H*-benzoimidazol-2-ylmethyl)-*N*-(2,6-dichlorophenyl) amine (Eryigit & Kendi, 1998). The N1—N2 [1.403 (2) Å] single-bond length is comparable with that in 2,6-bis(3,5-dimethylpyrazol-1-ylmethyl)pyridine (Manikandan *et al.*, 2000).

Atom O1 deviates from the pyrazoline mean plane by 0.028 (1) Å. The pyrazolone ring (C7–C9/N1/N2) is almost planar, with maximum deviation of 0.045 (2) Å for atom N2. It makes a dihedral angle of 49.68 (10)° with its attached phenyl ring (C1–C6). The phenolate residue (C11–C16/O2) is essentially planar, with maximum deviation of 0.031 (2) Å for O2. This plane makes dihedral angles of 16.78 (9) and 50.54 (9)°, respectively, with the pyrazolone ring (C7–C9/N1/N2) and the terminal (C1–C6) phenyl ring. The N2-N1-C6-C5 and C1-C6-N1-C9 torsion angles are -147.45 (18) and -116.1 (2)°, respectively.

In the crystal structure (Fig. 2), intramolecular C10—H10A···O1 hydrogen bond interactions generate an *S*(6) ring motif (Bernstein *et al.*, 1995). The crystal packing is consolidated by weak non-classical intermolecular C17—H17B···O1 hydrogen bonds (Table 1). The combination of both intra and intermolecular C—H···O hydrogen bonds stabilize the crystal

structure. There exists an unusual short contact between atoms I1 and C8 with a distance of 3.3606 (17) Å, which is shorter than the sum of their van der Waals radii.

Experimental

The title compound was synthesized by the reaction of mono Schiff base (1 g, 0.0032 mol) with dibromo butane (0.0016 mol) in the presence of freshly heated K_2CO_3 (0.0097 mol) and tetrabutylamonium iodide (PTC) (0.0004 mol) in dry acetone with continuous stirring at 40 °C for 8h. After the completion of the reaction, the product obtained was purified by passing through silica-gel column (60-120 mesh) and further crystallized from methanol. Yield: 65 %; m. p. 136 °C. IR (KBr) ν_{max} cm^{-1}: 3014 (C–H aromatic), 1666 (C═O), 1571 (HC═N), 1299 (C–O), 1108 (C–N). ^{1}H-NMR ($CDCl_3$) δ: 10.13 (s, 1H, C–H olefinic), 8.22-6.96 (m, 9H, C–H aromatic), 3.57 (s, O–CH_2CH_2), 3.33 (s, N–CH_3), 2.92 (s, I–CH_2), 2.22 (s,-CH_3), 2.11 (s, 2×CH_2).

Refinement

All hydrogen atoms were positioned geometrically (C–H = 0.93–0.97 Å) and were refined using a riding model, with U_{iso}(H) = 1.2 or 1.5U_{eq}(C). A rotating group model was used for the methyl group. The highest peak of 1.26 eÅ^3 was found at a distance of 0.70 Å from I1 and the deepest hole of -1.68 eÅ^3 was at a distance of 0.54 Å from I1.

Figures

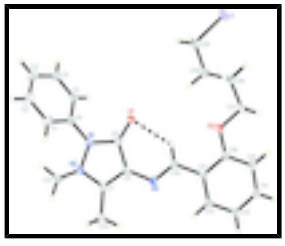

Fig. 1. The asymmetric unit of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme. An intramolecular hydrogen bond is shown as dashed line.

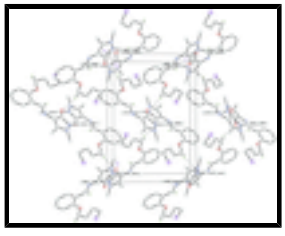

Fig. 2. The crystal packing of the title compound, showing hydrogen-bonded (dashed lines) network. H atoms not involved in the hydrogen bond interactions are omitted for clarity.

Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 9944 reflections

a = 11.5235 (10) Å	θ = 2.7–35.4°
b = 16.4156 (14) Å	μ = 1.53 mm^{-1}
c = 11.2828 (9) Å	T = 100 K
β = 94.010 (2)°	Blcok, yellow
V = 2129.1 (3) Å^3	0.41 × 0.34 × 0.29 mm
Z = 4	

Data collection

Bruker APEXII DUO CCD area-detector diffractometer	9632 independent reflections
Radiation source: fine-focus sealed tube	7935 reflections with $I > 2\sigma(I)$
graphite	R_{int} = 0.025
φ and ω scans	θ_{max} = 35.6°, θ_{min} = 2.2°
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	h = −16→18
T_{min} = 0.571, T_{max} = 0.663	k = −26→26
36214 measured reflections	l = −17→18

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.042	Hydrogen site location: inferred from neighbouring sites
$wR(F^2)$ = 0.159	H-atom parameters constrained
S = 1.05	$w = 1/[\sigma^2(F_o^2) + (0.1027P)^2 + 1.5532P]$ where $P = (F_o^2 + 2F_c^2)/3$
9632 reflections	$(\Delta/\sigma)_{max}$ = 0.001
255 parameters	$\Delta\rho_{max}$ = 1.26 e Å^{-3}
0 restraints	$\Delta\rho_{min}$ = −1.68 e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ($Å^2$)

Received 26 May 2010; accepted 29 May 2010

Key indicators: single-crystal X-ray study; T = 296 K; mean σ(C–C) = 0.003 Å; R factor = 0.038; wR factor = 0.106; data-to-parameter ratio = 15.0.

In the title compound, $C_9H_{11}ClN_2O_3S$, the dihedral angle between the benzene ring and the amido –NHCO– plane is 15.0 (2)°. An intramolecular C—H···O hydrogen bond generates an S(6) ring motif. In the crystal structure, the amino NH_2 group is involved in intermolecular N—H···O hydrogen bonds, which connect the molecules into a double layer structure expanding parallel to the *bc* plane. The layers are further linked by an amido N—H···O hydrogen bond. Between the layers, a weak π–π interaction with a centroid–centroid distance of 3.7447 (12) Å is also observed.

3-Chloro-*N*-(4-sulfamoylphenyl)propanamide

M. Akkurt, S.P. Yalçin, H. Türkmen and O. Büyükgüngör

Comment

Sulfanilamide is a sulfonamide antibacterial. Chemically, it is a molecule containing the sulfonamide functional group attached to an aniline. As an antibiotic, it functions by competitively inhibiting (*i.e*, by acting as a substrate analogue) enzymatic reactions involving. Inhibition of the zinc enzyme carbonic anhydrase (CA, EC 4.2.1.1) with sulfonamides may be exploited clinically for the treatment and prevention of a multitude of diseases (Pastorekova *et al.*, 2004; Supuran *et al.*, 2004; Mann & Keilin, 1940). With the early report that sulfanilamide acts as an inhibitor of CA, a great scientific adventure initiated, leading to the development of several classes of drugs based on the sulfonamide motif.

Sulfonamides and their derivatives have been the subject of investigation for many reasons. The amides are important constituent of many biologically significant compounds. The chemistry of sulfonamides is of interest as they show distinct physical, chemical and biological properties. The sulfonamide derivatives are known for their numerous pharmacological activities, antibacterial, antitumor, insulin-release stimulation and antithyroid properties (Maren, 1976). In addition, the unsubstituted aromatic/heterocyclic sulfonamides act as carbonic anhydrase inhibitors (Supuran & Scozzafava, 2001; Türkmen *et al.*, 2005; Supuran *et al.*, 2003) whereas other types of derivatives show diuretic activity (high-ceiling diuretics or thiadiazine diuretics), hypoglycemic activity and anti- cancer properties (Supuran & Scozzafava, 2002). Although sulfonamides are best known as bacteriostatic (Silverman, 1992) and antimalarial agents (Albala *et al.*, 1994), there is now a range of drugs, possessing very different pharmacological activities, in which the sulfonamide group is present (Reynolds, 1996). Due to their significant pharmacology applications and widespread use in medicine, these compounds have gained attention in bio-inorganic and metal-based drug chemistry. In this work we report the crystal structure of 3-chloro-*N*-(4-sulfamoylphenyl)propanamide.

In the title molecule (I), (Fig. 1), the S═O distances [1.4302 (14) and 1.4349 (16) Å] and the O═S═O angle [118.21 (9)°] are within the normal range as the values of the other geometric parameters of the molecule. The dihedral angle between the benzene ring and the amido –NHCO– plane is 15.0 (2)°.

The crystal structure is stabilized by N—H···O type hydrogen bonds (Table 1, Fig. 2). N1—H1A···O1 and N1—H1B···O3 generate the two-dimensional network (double layer structure), but N2—H2A···O2 links the layers into a three-dimensional network. An intramolecular hydrogen contact C3—H3···O3 generates a ring of graph-set motif S(6) (Bernstein *et al.*, 1995) (Table 1). Furthermore, crystal packing is influenced by weak π–π stacking interactions between nearby aromatic rings of the adjacent molecules, [$Cg\cdots Cg^{iv}$ = 3.7447 (12) Å; *Cg* is the centroid of the C1–C6 ring; symmetry code: (iv) 1 - *x*, 1 - *y*, 1 - *z*].

Experimental

Sulfanilamide (2.00 g, 0.011 mol) and *N*-ethylmaleimide (NEM) (1.566 g, 0.016 mol) were stirred in tetrahydrofuran (THF) (200 ml) until most of the starting material had dissolved. 3-Chloropropanoylchloride (1.782 g, 0.014 mol) in THF was slowly added to the reaction mixture. The reaction was stirred at 258 K for 4 h under anhydrous conditions. After warming to room temperature the white precipitate of NEM/HCl salt filtered off. The THF was removed in *vacuo* and the resulting

white solid dissolved in ethyl acetate. The organic extract was washed with 3*M* hydrochloric acid (20 ml) then with saturated sodium bicarbonate solution (20 ml) and finally with brine. Drying over magnesium sulfate and evaporation yielded a white solid which was recrystallized from water to give the title compound (yield: 70%, m.p: 501–503 K).

Refinement

The H-atoms of the NH_2 group were located in a difference Fourier map, and were refined with distance restraints of N—H = 0.86 (2) Å; their temperature factors were freely refined. The other H-atoms were placed in calculated positions with C—H = 0.93–0.97 Å and N—H = 0.86 Å, and were included in the refinement in the riding model approximation, with U_{iso}(H) = 1.2U_{eq}(C, N).

Figures

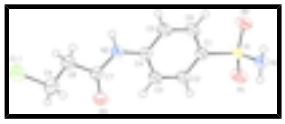

Fig. 1. The title molecule with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 50% probability level.

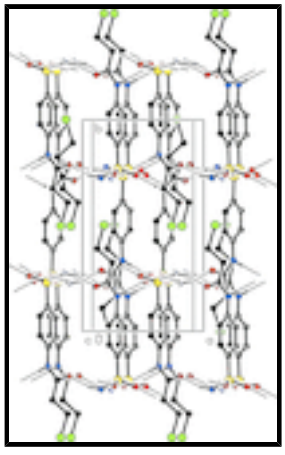

Fig. 2. The packing of the molecules of (I) linked by of N—H···O hydrogen bonds, viewed down the *c* axis. All hydrogen atoms not involved in hydrogen bonding have been omitted for clarity. Hydrogen bonds are indicated by dotted lines.

a = 7.7554 (4) Å	θ = 2.1–28.0°
b = 14.8191 (8) Å	μ = 0.52 mm^{-1}
c = 9.7482 (5) Å	*T* = 296 K
β = 94.181 (4)°	Prism, colourless
V = 1117.36 (10) Å^3	0.78 × 0.45 × 0.22 mm
Z = 4	

Data collection

Stoe IPDS2 diffractometer	2294 independent reflections
Radiation source: sealed X-ray tube, 12 x 0.4 mm long-fine focus	2007 reflections with $I > 2\sigma(I)$
plane graphite	$R_{int} = 0.040$
Detector resolution: 6.67 pixels mm^{-1}	$\theta_{max} = 26.5°$, $\theta_{min} = 2.5°$
ω scans	$h = -8 \rightarrow 9$
Absorption correction: integration (*X-RED32*; Stoe & Cie, 2002)	$k = -16 \rightarrow 18$
$T_{min} = 0.754$, $T_{max} = 0.892$	$l = -12 \rightarrow 12$
6023 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.106$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.08$	$w = 1/[\sigma^2(F_o^2) + (0.0602P)^2 + 0.351P]$ where $P = (F_o^2 + 2F_c^2)/3$
2294 reflections	$(\Delta/\sigma)_{max} < 0.001$
153 parameters	$\Delta\rho_{max} = 0.28$ e Å^{-3}
2 restraints	$\Delta\rho_{min} = -0.44$ e Å^{-3}

Special details

Geometry. Bond distances, angles *etc*. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted *R*-factors *wR* and all goodnesses of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating -*R*-factor-obs *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.001 Å; R factor = 0.023; wR factor = 0.082; data-to-parameter ratio = 27.3.

The title complex, $[Cu(C_4H_5O_6)_2(H_2O)_2]\cdot 2H_2O$, contains a Cu^{II} ion lying on an inversion centre. The coordination geometry of the Cu^{II} ion is a distorted octahedron with four O atoms from two hydrogen tartrate ions occupying the equatorial positions and two O atoms from two coordinated water molecules occupying the axial positions. In the crystal structure, intermolecular O—H···O and C—H···O hydrogen bonds link the molecules into a three-dimensional network.

Diaquabis(hydrogen tartrato)copper(II) dihydrate

M. T. M. Al-Dajani, H. H. Abdallah, N. Mohamed, M. Hemamalini and H.-K. Fun

Comment

In recent years, there has been great interest in the study of coordination polymers with network structures due to their possible chemical and physical properties (Stang & Olenyuk, 1997; Aakeroy & Seddon, 1993; Munakata *et al.*, 1999). A number of unique networks have been obtained by reactions between transition metal ions and rationally designed organic ligands (Fujita *et al.*, 1994; Hagrman *et al.*, 1997). Tartaric acid has been used as building blocks to construct 1D, 2D and 3D frameworks due to the diversity of binding modes of the carboxyl group and hydroxyl group in the tartaric acid. It has many applications such as in making silver mirrors, in the manufacture of soft drinks, to provide tartness to foods, in tanning leather, and in making blueprints. Tartaric acid also has optical activity (Synoradzki *et al.*, 2008). We report the crystal structure of (I).

(I) consists of a copper ion lying on a crystallographic inversion centre, two hydrogen tartrate ions, two coordinated water molecules and two uncoordinated water molecules (Fig. 1). The environment about the copper(II) ion is a distorted octahedron with four oxygen atoms from two hydrogen tartrate ions and two oxygen atoms from the coordinated water molecules completing the coordination. All the four oxygen atoms from the two hydrogen tartrate anions occupy equatorial positions and the oxygen atoms from the water molecules occupy in the axial positions. The equatorial and axial distances of Cu—O [Cu—O1 = 1.9327 (7) Å; Cu—O2 = 1.9637 (7) Å and Cu—O1W = 2.4651 (8) Å] agree with those reported for similar systems (Jian *et al.*, 2005).

In the crystal structure, intermolecular O1W—H12···O4, O4—H4···O1W, O2—H5···O2W, O6—H6···O3, O1W—H11···O5, O2W—H21···O1, O2W—H22···O5, C2—H2···O6 and C3—H3···O4 hydrogen bonds (Table 1) link the molecules into a three-dimensional network.

Experimental

DL-Tartaric acid (0.02 mol, 3.0 g) was dissolved in distilled water in a flat bottom flask with magnetic stirrer. $CuCl_2$ (0.01 mol, 1.45 g) was added in small portions with continuous stirring for three hours at room temperature. The blue crystals formed were washed with *N,N*-dimethylformamide then with methanol and dried at 353 K.

Refinement

Atom H5 was located in a difference Fourier map and refined freely. The remaining H atoms, excepting the water H atoms, were positioned geometrically (C—H = 0.98 Å and O—H = 0.82 Å) and were refined using a riding model, with U_{iso}(H) = 1.2U_{eq}(C) or 1.5U_{eq}(O). The water H atoms were located in the difference map and then treated as riding atoms on the parent O atoms, with O—H = 0.8936–0.9551 Å and U_{iso}(H) = 1.5U_{eq}(O).

Figures

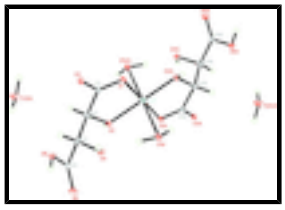

Fig. 1. The molecular structure of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme. C1A–C4A/O1A–O6A/O1WA/O2WA are generated by the symmetry code 1-*x*, -*y*, -*z*.

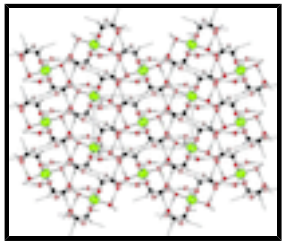

Fig. 2. The crystal packing of the title compound, showing hydrogen-bonded (dashed lines) network.

Diaquabis(hydrogen tartrato)copper(II) dihydrate

Crystal data

$[Cu(C_4H_5O_6)_2(H_2O)_2]\cdot 2H_2O$	$F(000) = 446$
$M_r = 433.76$	$D_x = 1.915$ Mg m^{-3}
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2ybc	Cell parameters from 6852 reflections
$a = 7.1577$ (8) Å	$\theta = 3.6$–$35.0°$
$b = 14.0989$ (14) Å	$\mu = 1.54$ mm^{-1}
$c = 7.8910$ (8) Å	$T = 100$ K
$\beta = 109.136$ (2)°	Plate, blue
$V = 752.32$ (14) Å^3	0.42 × 0.15 × 0.08 mm
$Z = 2$	

Data collection

Bruker APEXII DUO CCD area-detector diffractometer	3298 independent reflections
Radiation source: fine-focus sealed tube	3001 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.023$
φ and ω scans	$\theta_{max} = 35.0°$, $\theta_{min} = 2.9°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -11 \rightarrow 11$
$T_{min} = 0.563$, $T_{max} = 0.885$	$k = -21 \rightarrow 22$
12361 measured reflections	$l = -12 \rightarrow 12$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.023$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.082$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.20$	$w = 1/[\sigma^2(F_o^2) + (0.0456P)^2 + 0.1293P]$ where $P = (F_o^2 + 2F_c^2)/3$
3298 reflections	$(\Delta/\sigma)_{max} = 0.001$
121 parameters	$\Delta\rho_{max} = 0.68$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.45$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2, conventional R-factors R are based on F, with F set to zero for negative F^2. The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Received 2 June 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.045; wR factor = 0.161; data-to-parameter ratio = 15.6.

In the title compound, $C_{20}H_{15}N_3O_3S$, an intramolecular C—H···O hydrogen bond generates an S(6) ring motif. The chromene ring system is inclined at dihedral angles of 14.21 (9) and 9.91 (10)°, respectively, with respect to the thiazole and benzene rings. The thiazole ring makes a dihedral angle of 24.06 (11)° with the benzene ring. In the crystal structure, O—H···O hydrogen bonds link the molecules into a zigzag chain along [20$\bar{1}$]. Weak N—H···O and C—H···O interactions connect the chains into a three-dimensional network. π–π stacking interactions with a centroid–centroid distance of 3.4209 (14) Å are also observed between the chains.

Comment

Aminothiazole ring is found to be associated with diverse pharmacological activities such as antifungal (Hiremath *et al.*, 1992), anti-tuberculosis (Gursoy & Karah, 2000), anti-inflammation (Jayashree *et al.*, 2005) and antihypertensive (Patt *et al.*, 1992). In addition, coumarin and its derivatives also exhibit significant enzyme inhibition (Hofmanova *et al.*, 1998), anticoagulant (Anderson *et al.*, 2002) and free radical scavenging (Finn *et al.*, 2004) activities. The title compound is a new derivative of thiazolyl coumarin. We present here its crystal structure.

Bond lengths (Allen *et al.*, 1987) and the angles of the title compound (Fig. 1), are within the normal range and comparable with a related structure (Arshad *et al.*, 2010). The molecular structure is stabilized by intramolecular C11—H11A···O2 hydrogen bond which generates an *S*(6) ring motif (Bernstein *et al.*, 1995). The chromene (O1/C1–C9) ring system and thiazole (S1/N1/C10–C12) ring are approximately planar, with the maximum deviation of 0.021 (2) Å for atom O1 and 0.008 (2) Å for atom C10. The chromene ring system is inclined at angles of 14.21 (9) and 9.91 (10)° with respect to the thiazole and benzene (C14–C19) rings, respectively. The thiazole ring makes a dihedral angle of 24.06 (11)° with the benzene ring.

In the crystal packing (Fig.2), the N2—H12N···O3 and C5—H5A···O3 interactions form a pair of bifurcated acceptor bonds which together with O3—H13O···O2 interactions link the independent molecules into a three-dimensional network. The short intermolecular distance [3.4209 (14) Å] between symmetry-related S1/N1/C10–C12 (centroid *Cg*1) and O1/C1/C2/C7–C9 (centroid *Cg*2) rings [symmetry code: -*x*, -*y*, -*z*] indicates the existence of π–π stacking interaction.

Experimental

4-Hydroxyacetophenone thiosemicarbazone (Liu *et al.*, 2008) and 3-[ω-bromoacetyl coumarin] (Siddiqui *et al.*, 2009) were synthesized as reported in the literature. The title compound was obtained by the cyclocondensation of 4-hydroxyacetophenone thiosemicarbazone with 3-[ω-bromoacetyl coumarin]. A solution of 3-[ω-bromoacetyl coumarin] (2.5 mmol) and 4-hydroxyacetophenone thiosemicarbazone (2.5 mmol) in chloroform-ethanol (2:1) was refluxed for 45 minutes at 60 °C to get dense yellow precipitates. The reaction mixture was cooled in ice bath and basified with ammonia to pH 7–8. The title compound was recrystallized from ethanol-chloroform (3:2) as yellow needle-like crystals.

Refinement

Atoms H12N and H13O were located in a difference Fourier map and allowed to be refined freely. The rest of H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93–0.96 Å, and with U_{iso}(H) = 1.2 U_{eq}(C) or 1.5 U_{eq}(C). A rotating-group model was applied for the methyl groups.

Figures

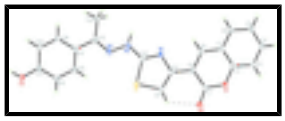

Fig. 1. The molecular structure of the title compound showing 50% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme. Intramolecular interaction is shown by a dashed line.

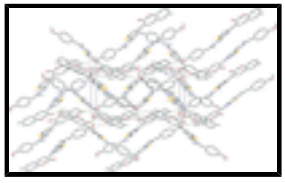

Fig. 2. The crystal structure of the title compound viewed along the *c* axis. H atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

Hall symbol: -P 2ybc	Cell parameters from 2347 reflections
$a = 9.1117$ (16) Å	$\theta = 2.8$–$27.3°$
$b = 16.225$ (3) Å	$\mu = 0.21$ mm^{-1}
$c = 12.113$ (2) Å	$T = 100$ K
$\beta = 104.657$ (3)°	Needle, yellow
$V = 1732.5$ (5) Å^3	0.38 × 0.06 × 0.05 mm
$Z = 4$	

Data collection

Bruker SMART APEXII DUO CCD area-detector diffractometer	3957 independent reflections
Radiation source: fine-focus sealed tube	2932 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.060$
φ and ω scans	$\theta_{max} = 27.5°$, $\theta_{min} = 2.1°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -11 \rightarrow 11$
$T_{min} = 0.922$, $T_{max} = 0.990$	$k = -21 \rightarrow 21$
16535 measured reflections	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.161$	H atoms treated by a mixture of independent and constrained refinement

S = 1.10	$w = 1/[\sigma^2(F_o^2) + (0.0927P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3957 reflections	$(\Delta/\sigma)_{max} = 0.001$
253 parameters	$\Delta\rho_{max} = 0.40$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.41$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Received 2 June 2010; accepted 7 June 2010

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.004 Å; R factor = 0.051; wR factor = 0.132; data-to-parameter ratio = 13.9.

In the decahydrophenanthrenone ring system of the title compound, $C_{27}H_{44}O$, the two cyclohexane rings adopt chair conformations, whereas the cyclohexene ring adopts an envelope conformation. The cyclopentane ring is twisted. In the crystal structure, molecules are stacked along the a axis, but no significant intermolecular interactions are observed.

Comment

Steroids are compounds of biological origin and play an important role in biological systems. The dramatic expansion of steroidal chemistry came with the discovery of steroidal hormones. The discovery of several steroids with their wide application in therapy have brought about an increasing interest (Grover *et al.*, 2007). During the last decade, the major efforts of the chemists were directed towards the modification of the structures of steroids in order to enhance their biologically activity (Khan & Yusuf, 2009; Drach *et al.*, 2000).

The bond lengths (Allen *et al.*, 1987) and angles in the title compound (Fig. 1) are within normal ranges. The cyclopentane ring, C1/C14–C17 is twisted about the C1–C14 with the puckering parameters (Cremer & Pople, 1975) Q = 0.442 (3) Å and φ = 191.8 (3)°. In the tetradecahydrophenanthrene ring system, two cyclohexane rings, C5—C10 and C1—C4/C13/C14 adopt chair conformations with the puckering parameters Q = 0.539 (3) Å, Θ = 170.8 (3)° and φ = 320 (2)°; and Q = 0.585 (3) Å, Θ = 173.3 (3)° and φ = 150 (2) °, respectively, whereas C4/C5/C10—C13 adopts an envelope conformation with atom C4 deviating by 0.317 (2) Å from the mean plane through the remaining atoms, puckering parameters Q = 0.456 (3) Å, Θ = 51.6 (4)° and φ = 343.4 (4)°. The butyl (C19—C22) substituent at C18 is nearly planar, this plane lying almost perpendicular to the least-squares plane of the cyclopentane ring. The maximum deviation of the atoms C19, C20, C21 and C22 from their mean plane is 0.002 (3) Å for atoms C19, C21 and C22; and the dihedral angle between the plane of the butyl group and the least-squares plane through cyclopentane ring is 80.0 (2)°. In the crystal packing (Fig. 2), the molecules are stacked along the crystallographic *a* axis.

Experimental

A solution of butyl chromate [*tert*-butyl alcohol (60 ml), CrO_3 (20 g), acetic acid (84 ml) and acetic anhydride (10 ml)] (Ruiz, 1958) was added at 0 °C to a solution of cholest-5-ene (8 g) in CCl_4 (150 ml), acetic acid (30 ml) and acetic anhydride (10 ml). The contents were refluxed for 3 h and then diluted with water. The organic layer was washed with sodium bicarbonate solution (5%) and water; and then dried over anhydrous sodium sulfate. Evaporation of the solvents under reduced pressure provided cholest-5-en-7-one which was crystallized from methanol (3.1 g), *m.p.* 128 °C (reported, *m.p.* 125–129 °C; Dauben & Takemura, 1953).

Refinement

All H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93–0.98 Å and U_{iso}(H) = 1.2 or 1.5 U_{eq}(C). A rotating-group model was applied for the methyl groups. The highest residual electron density peak is located at 0.07 Å from C24 and the deepest hole is located at 0.60 Å from C24. In the absence of significant anomalous dispersion, 2670 Friedel pairs were merged in the final refinement.

Figures

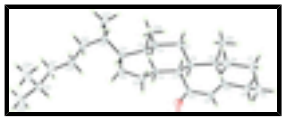

Fig. 1. The molecular structure of the title compound, showing 50% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme.

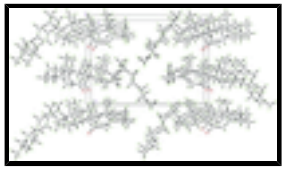

Fig. 2. The crystal structure of the title compound viewed along the *a* axis.

Crystal data

$C_{27}H_{44}O$	$F(000) = 428$
$M_r = 384.62$	$D_x = 1.115$ Mg m^{-3}
Monoclinic, $P2_1$	Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å
Hall symbol: P 2yb	Cell parameters from 2115 reflections
$a = 6.3468$ (13) Å	$\theta = 2.2$–$27.8°$
$b = 11.517$ (3) Å	$\mu = 0.07$ mm^{-1}
$c = 15.678$ (3) Å	$T = 100$ K
$\beta = 91.470$ (5)°	Plate, colourless
$V = 1145.6$ (4) Å^3	0.25 × 0.18 × 0.03 mm
$Z = 2$	

Data collection

Bruker SMART APEXII DUO CCD area-detector diffractometer	3512 independent reflections
Radiation source: fine-focus sealed tube	2776 reflections with $I > 2\sigma(I)$
graphite	$R_{int} = 0.058$
φ and ω scans	$\theta_{max} = 30.2°$, $\theta_{min} = 1.3°$
Absorption correction: multi-scan (*SADABS*; Bruker, 2009)	$h = -8 \rightarrow 8$
$T_{min} = 0.984$, $T_{max} = 0.998$	$k = -16 \rightarrow 16$
13066 measured reflections	$l = -21 \rightarrow 22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.132$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0534P)^2 + 0.3776P]$

	where $P = (F_o^2 + 2F_c^2)/3$
3512 reflections	$(\Delta/\sigma)_{max} = 0.001$
252 parameters	$\Delta\rho_{max} = 0.51$ e Å^{-3}
1 restraint	$\Delta\rho_{min} = -0.44$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 293 K; mean σ(C–C) = 0.002 Å; R factor = 0.043; wR factor = 0.085; data-to-parameter ratio = 17.3.

In the title compound, $C_{24}H_{24}N_2O_2$, the five-membered ring of the indoline ring system adopts an envelope conformation with the spiro C atom at the flap. The dihedral angle between the benzene ring of the indoline ring system and the naphthalene ring system is 71.70 (7)°. In the crystal structure, pair of weak C—H···O hydrogen bonds link the molecules into centrosymmetric dimers.

2'-Ethoxy-1,3,3-trimethylspiro[indoline-2,3'-3*H*-naphtho[2,1-*b*][1,4]oxazine]

J. Lin, W. Chai, Y. Yang, J. He and K. Shu

Comment

Serve as an organic photochromic, spirooxazines have real or potential applications in many field, such as protection, decoration, display, memory, switches, photography, photometry and photomechanics (Chibisov & Gardner, 1999). For further approach to real applications, numerous types of spirooxazine derivatives have been reported over the past several decades (Pozzo *et al.*, 1993; Khairutdinov *et al.*, 1998; Zhang *et al.*, 2008). Traditionally, synthesis of spirooxazines is based on a thermal condensation reaction of the corresponding alkylidene heterocycle or its conjugate acid with *ortho*-hydroxynitroso aromatic derivatives in most polar organic solvents. To be notice, alkylidene heterocycle, such as: 1,3,3-trimethyl-2- methyleneindoline derivatives, were not stable in the air at room temperature, so they must be purified by vacuum distillation before use (Tan *et al.*, 2005). This brings to a big problem that we have to re-synthesis alkylidene heterocycle part if we want to get a novel spirooxazine with different substituents at alkylidene heterocycle moiety. According to our previous work (Lin *et al.*, 2009) in which we reported a new strategy to get a 2'-position substituted spirooxazine, a new derivative, 1,3,3-trimethyl-2'-ethoxy-1,3-dihydrospiro(indole-2,3'-naphtho(2,1-b) (1,4)oxazine), (II), has been synthesized and its crystal structure is reported here.

Since we synthesized an unexpected new organic photochromic compound, (2*S*)-2'-ethoxy-1,3,3-trimethyl-6'-(piperidin-1-yl) spiro[indoline-2,3'-3'H-naphtho[2,1-*b*][1,4]oxazine], we studied on the possibility of the ethoxy reaction at the 2'-position of spirooxazine using another spirooxazine derivative, $C_{22}H_{20}N_2O$, (I). The title compound, $C_{24}H_{24}N_2O_2$, (II), was synthesized successfully (Fig. 1), which testified it is a general method to fabricate ethoxy-substituted (may be alkoxy-substituted) spirooxazines at the C2'carbon atom of the C2'=N1' bond.

The title compound, $C_{24}H_{24}N_2O_2$, consists of an ethoxy group bonded to parent molecule (I) at the 2'-position crystallizing with a molecule in the asymmetric unit (Fig. 2). The five-membered ring C1/N2/C6–C8 adopts an envelope conformation with the flap at C8. The dihedral angle between the benzene ring (atoms C1–C6) and the naphthalene ring (atoms C10–C19) is 71.70 (7)°. For the other 2'-position substituted derivatives ($C_{23}H_{22}N_2O_2$, $C_{27}H_{24}N_2O_2$ and $C_{29}H_{33}N_3O_2$), the corresponding dihedral angles are 74.2 (1), 76.5 (6) and 71.6 (2)/72.7 (2)°, respectively (Uznanski *et al.*, 2001; Lin *et al.*, 2009). The bond lengths and angles around the spiro carbon in (II) are similar to those in the other photochromic spirooxazines.

Experimental

Potassium iodide (17 mg, 0.1 mmol) and the parent spirooxazine, 1,3,3-trimethylspiro[indoline-2,3'-[3H]-naphth[2,1-*b*][1,4]oxazine] (33 mg, 0.1 mmol) were heated in a Teflon-lined stainless steel autoclave with ethanol (10 ml) at 393 K. Block-shaped colorless crystals of (II), were obtained by slow evaporation from the filtrated reaction solution at room temperature. Yield: 45% (with reaction solution left). m.p.: 418–419 K. IR (KBr, cm^{-1}): 3053, 2982, 2964, 2888, 1724, 1714, 1637, 1609, 1577, 1508, 1490, 1466, 1398, 1383, 1367, 1321, 1296, 1267, 1252, 1232, 1198, 1188, 1153, 1140, 1101, 1086, 1037, 1024, 993, 977, 952, 895, 862, 816, 781, 750, 743, 683, 655, 632, 606, 566, 551, 516, 499, 437. ^{1}H NMR ($CDCl_3$): δ

6.56–8.47 (10*H*, ArH), 4.58 (2*H*, CH_2), 2.94 (3*H*, CH_3), 1.42 (3*H*, CH_3), 1.22 (6*H*, CH_3). Analysis found (calculated) for $C_{24}H_{24}N_2O_2$: C 77.35 (77.39), H 6.60 (6.49), N 7.50% (7.52%).

Refinement

The H atoms were placed in their calculated positions (C—H = 0.93–0.97 Å) and included in the refinement using the riding model, with U_{iso}(H) = 1.2 or 1.5U_{eq}(C).

Figures

Fig. 1. Synthesis of the title compound, (II).

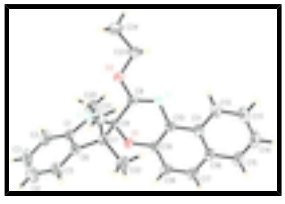

Fig. 2. The structure of (II), showing the atom-labeling scheme of the asymmetric unit. Displacement ellipsoids are drawn at the 30% probability level and H atoms are shown as small spheres of arbitrary radii.

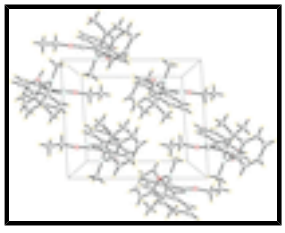

Fig. 3. A packing diagram of (II), viewed along the *a* axis.

$w = 1/[\sigma^2(F_o^2) + (0.030P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{max} < 0.001$

$\Delta\rho_{max}$ = 0.16 e $Å^{-3}$

$\Delta\rho_{min}$ = −0.18 e $Å^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.

Key indicators: single-crystal X-ray study; T = 100 K; mean σ(C–C) = 0.003 Å; R factor = 0.059; wR factor = 0.204; data-to-parameter ratio = 21.6.

The title compound, $C_{10}H_{10}N_2O$, crystallizes with two independent molecules in the asymmetric unit, having closely comparable geometries. The dihedral angles between the 1*H*-pyrazole and benzene rings in the two molecules are 39.57 (14) and 41.95 (13)°. The two molecules are each connected to neighbouring molecules by pairs of intermolecular O—H···N hydrogen bonds, forming dimers with $R_2^2(8)$ ring motifs. These dimers are further linked into $R_4^4(10)$ ring motifs by intermolecular N—H···O hydrogen bonds, forming chains along [101]. The crystal structure is further stabilized by a C—H···π interaction.

4-Methyl-5-phenyl-1*H*-pyrazol-3-ol

T. Shahani, H.-K. Fun, R. V. Ragavan, V. Vijayakumar and S. Sarveswari

Comment

Pyrazolone derivatives have a broad spectrum of biological activities being used as analgesic, antipyretic and anti-inflammatory therapeutical drugs (Brogden, 1986; Gursoy *et al.*, 2000). A class of new compounds with the pyrazolone moiety was synthesized and reported for their antibacterial and antifungal activities by Ragavan *et al.* (2009, 2010). A new pyrazolone derivative, edaravone (3-methyl-1-phenyl-2-pyrazoline-5-one), is being used as a drug in clinical practice for brain ischemia (Watanabe *et al.*, 1984; Kawai *et al.*, 1997) and the same has been found to be effective against myocardial ischemia (Wu *et al.*, 2002).

There are two independent molecules (A and B) in the asymmetric unit (Fig. 1). The maximum deviations in 1*H*-pyrazole ring (N1/N2/C7–C9) for molecules A and B are 0.006 (2) and 0.011 (2) Å, respectively, at atoms C6A and C6B. The dihedral angles formed between the 1*H*-pyrazole ring and benzene ring in molecules A and B are 39.57 (14) and 41.95 (13)°, respectively. The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges and comparable to those closely related structures (Shahani *et al.*, 2009, 2010*a*–*c*).

In the crystal packing (Fig. 2), pairs of intermolecular O1A—H1OA···N2A and O1B—H1OB···N2B hydrogen bonds (Table 1) form dimers with neighbouring molecules, generating $R_2^2(8)$ ring motifs (Bernstein *et al.*, 1995). These dimers are further linked into $R_4^4(10)$ ring motifs by additional intermolecular N1A—H1NA···O1B and N1B—H1NB···O1A hydrogen bonds (Table 1), forming one dimensional chains along the [101] direction. The crystal structure is further stabilized by C—H···π interaction (Table 1), involving the C1B—C6B benzene ring (centroid *Cg*1).

Experimental

The compound 4-methyl-5-phenyl-1-*H*-pyrazol-3-ol has been synthesized using the method available in the literature (Ragavan *et al.*, 2009, 2010) and recrystallized using the ethanol (white solid). *m.p.* 278.5–493 K.

Refinement

The H atoms bound to O atoms were located in a difference map and constrained to ride with their parent atoms, with U_{iso}(H) = 1.5U_{eq}(O) (O—H = 0.83 Å). The H atoms bound to N atoms were located in a difference map and were refined freely [refined N—H lengths, 1.00 (3) and 0.97 (2) Å]. All other H atoms were positioned geometrically (C—H = 0.93–0.96 Å], with U_{iso}(H) = 1.2 or 1.5U_{eq}(C).

$T_{min} = 0.970$, $T_{max} = 0.993$	$k = -15 \rightarrow 13$
19166 measured reflections	$l = -19 \rightarrow 19$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.059$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.204$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0985P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
5255 reflections	$(\Delta/\sigma)_{max} = 0.001$
243 parameters	$\Delta\rho_{max} = 0.33$ e Å^{-3}
0 restraints	$\Delta\rho_{min} = -0.26$ e Å^{-3}

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
