Received 18 May 2010; accepted 21 May 2010

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.064; wR factor = 0.173; data-to-parameter ratio = 11.9.

The title molecule, $\text{C}_5\text{H}_7\text{N}_3\text{O}_2$, has an almost planar conformation, with a maximum deviation of 0.043 (3) Å, except for the methyl H atoms. In the crystal structure, intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules into layers parallel to the bc plane. Intermolecular $\pi-\pi$ stacking interactions [centroid-centroid distances = 3.685 (2) and 3.697 (2) Å] are observed between the parallel triazole rings.

Methyl 1-methyl-1*H*-1,2,3-triazole-4-carboxylate

F. N. Khan, K. Prabakaran, S. M. Roopan, V. R. Hathwar and M. Akkurt

Comment

1,2,3-Triazoles are useful synthetic targets in organic synthesis and are associated with biological properties such as antiviral, antibacterial, antiepileptic and antiallergic (Velazquez *et al.*, 1998; Genin *et al.*, 2000). They have also found applications as agrochemicals, dyes, photographic materials, and in corrosion inhibition (Fan & Katritzky, 1996; Dehne, 1994). In continuous of our earlier reports (Prabakaran *et al.*, 2009a,b), here the crystal structure of the title compound is presented.

As shown in Fig. 1, the conformation of the title molecule is almost planar, with a maximum deviation of -0.043 (3) Å for O1, except the H atoms of two methyl groups.

In the crystal structure, molecules connect to each other, via the intermolecular C—H...O hydrogen bonds (Table 1, Fig. 2), into two-dimensional layers parallel to the *bc* plane, and intermolecular π - π stacking interactions [$Cg1 \cdots Cg1(1-x, -y, 2-z) = 3.685(2)$ Å and $Cg1 \cdots Cg1(1-x, 1-y, 2-z) = 3.697(2)$ Å, where Cg1 is a centroid of the triazole ring] between the parallel triazole rings contribute to the stabilization of the structure.

Experimental

To methyl 1*H*-1,2,3-triazole-4-carboxylate (2 g) in dry DMF (15 ml) maintained at 273 K in nitrogen atmosphere, was added K_2CO_3 (1.3 g), methyl iodide (0.98 ml), the mixture was then stirred at 273 K for 1 h, allowed to warm to room temperature and stirred till completion of reaction, monitored by TLC. The reaction mixture on LCMS analysis showed three isomers well separated with their significant retention time and high purity. Three fractions were identified by mass spectroscopy. The solvent was evaporated under vacuo and the residue was isolated into individual isomers by column chromatography. The single crystals of the title compound for X-ray structure analysis were obtained from ether solution by slow evaporation.

Refinement

H atoms were positioned geometrically with C—H = 0.93-0.96 Å, and were refined in riding mode with $U_{iso}(H) = 1.2$ or $1.5U_{eq}(C)$. In the final refinement cycles, the inconsistent 33 reflections were omitted.

Figures

Fig. 1. The title molecule showing the atom-numbering scheme. The displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. View of the crystal packing of (I), viewed down the *a* axis. The H atoms not involved in the hydrogen bonding pattern have been omitted for clarity.

1108 independent reflections	$l = -10 \rightarrow 10$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.064$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.173$	H-atom parameters constrained
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0741P)^2 + 0.2349P]$
1108 reflections	where $P = (F_o^2 + 2F_c^2)/3$
93 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.26 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating $-R$ -factor-obs etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
